A biography tells an account of a person's life written in the third person in a narrative structure. Biographies can be studied to learn about how people reacted to, shaped, and constructed opportunities during historical periods and the cultural contexts in which they lived. They provide nonfiction information and communicate why a person's legacy is so important that it is documented. Reading biographies can help students reflect about how they should feel about historical people and events in terms of a dynamic process of continuity and change. Moreover, people in history are humanized by biographies that allow students to be drawn close to the past as they experience specific personalities and realities. Through this, biographies offer students a richer context of history, providing more opportunities for engagement as they connect with the people as well as the events of the times.

Some psychologists believe that if you are in a good mood and someone asks you to do something, you are likely to view the requester as truly in need of help. The favor seems (a) reasonable. Conversely, the theory suggests, when you are angry you perceive a requester as being manipulative. Dr. Sandra Milbery and Margaret Clark conducted an experiment that found the happier the subjects, the more likely they were to (b) yield to the wishes of another. In another study, Alice Isen and Paul Levin set out to make us a little happier to see if we would be more willing to do good deeds for others. Alice and Paul chose a library. One of them randomly gave cookies to some of the people who visited the library. Later, in a seemingly (c) unrelated encounter, the other researcher asked the patrons for help on a task. You guessed it — the patrons who got a cookie were more willing to help out. The experimenters then tried to (d) discard their findings by leaving dimes in public telephone booths. Some unwitting telephone users happened to get a little (e) profit while others found nothing. Shortly after either finding the dime or finding nothing, the subjects saw someone who had dropped a stack of papers. It turns out that significantly more of those who found the dime helped pick up the notes. If you can do something to make someone's day a little brighter, your generosity will pay you back for it.

There are questions we can ask about the origin of the universe, not all of ① them can be answered by science. Scientists can answer when and how the universe began, but cannot calculate the reason why it began, for example. That type of question must be explored through philosophy, religion, and other ways of thinking. The questions that scientists ② ask must be testable. Scientists have provided answers to testable questions that have helped us ③ calculate the age of the universe: like how distant are certain stars and how fast are they receding from us. Whether or not we can get a definitive answer, we can be confident in the process by which the explanations were developed, allowing us ④ to rely on the knowledge that is produced through the process of science. Someday we may find evidence to help us understand why the universe was created, but for the time being science will limit ⑤ itself to the last 13.7 or so billion years of phenomenon to investigate.

We spend plenty of energy convincing ourselves into making decisions we feel we ought to. To live our lives according to strict ① moral principles, we often fall back on willpower. And we all know what it feels like when our willpower feels drained: after a long, hard day at work, people often find themselves making ② poorer choices. Psychologist Roy Baumeister and colleagues put it to a closer test. People were invited to watch a sad movie. Half were told to react as they normally would, while the other half were instructed to ③ suppress their emotions. After the movie, they were all given a hand exerciser and asked to squeeze it for as long as they could. Those who had contained their emotions ④ gave up sooner. Why? Because self-control requires energy, which means we have less energy available for the next thing we need to do. And that's why resisting temptation, making hard decisions, or taking initiative all seem to draw from the ⑤ varied well of energy. So willpower isn't something that we just exercise – it's something we exhaust.

Related to making e-commerce successful is the fact that media companies must show a willingness to surrender some of the control they have had over packaging media content. ① Allowing customers to buy individual songs rather than an entire CD is one simple example of something recording labels showed remarkable resistance to until recently. ② Allowing a good deal more "try before you buy" free trial samples, such as Kindle's free book chapters, is another business practice that will have to be encouraged for online customers. ③ In fact, they don't give much value to free products because the provision of goods or services for free often leads to overconsumption. ④ Eventually, some publishers may even be willing to allow customers to create their own books by combining the essays of a favorite author, for example, or putting book themes together. ⑤ By encouraging promotion of such user-created books (yet while still providing royalties to authors), publishers may find that some of their readers have a better sense of how to tap into popular tastes than the companies themselves.

Nutrition affects the hormonal system. Fasting, feeding, and exercise alter hormonal balances. In people who become very thin, for example, altered hormonal balance causes their bones to lose minerals and weaken. Hormones also affect nutrition. Along with the nervous system, hormones regulate hunger and affect appetite. They carry messages to regulate the digestive system, telling the digestive organs what kinds of foods have been eaten and how much of each digestive juice to secrete in response. A hormone produced by the fat tissue informs the brain about the degree of body fatness and helps to regulate appetite. An altered hormonal state is thought to be at least partially responsible, too, for the loss of appetite that sick people experience. Hormones also regulate the body's reaction to stress, suppressing hunger and the digestion and absorption of nutrients. When there are questions about a person's nutrition or health, the state of that person's hormonal system is often part of the answer.

Working ____ (A) ____ with nutrition, hormones ____ (B) ____ physiological mechanisms including hunger, appetite, and the digestive system of the body.
