1. 다음 글을 읽고 물음에 답하시오.

Researchers at Trinity College Dublin and University College Dublin (UCD) have found that a yeast-based dietary supplement can strengthen immune cells involved in fighting cancer in mice. In experiments with obese laboratory mice, the researchers found that adding the supplement to the animals' diets changed the way immune cells developed and produced stronger cancer-fighting responses. Obesity can interfere with immune function, making it more difficult for the body to respond effectively to tumors. The new findings suggest that a yeast-based supplement could potentially help restore some of that lost immune activity. The research was published in the scientific journal Cell Reports. The study was led by Frederick Sheedy, Associate Professor in Immunology in Trinity's School of Biochemistry and Immunology, and Helen Roche, Professor in Nutrigenomics, UCD School of Public Health, Physiotherapy and Sports Science and Director of the UCD Conway Institute.

2. 다음 글의 제목으로 가장 적절한 것은?

Poor students are seldom allowed to be the heroes in Hollywood films (adults always must "save" them) while middle-class students are almost always the heroes of the films in which they are featured (they are always more clever than the adults in the film). This double standard, I believe, reflects the middle-class bias of American culture. The middle-class perspective is always the predominant and heroic perspective in film. While it would be convenient to simply blame Hollywood for this double standard, the truth is that these distorted images of poor and middle-class teens are a reflection of the distorted image that Americans as a whole have of various social classes. These representations are a fantasy of the middle class (that poor students are troubled and middle-class students are wise), but it is an illusion that extends beyond the middle class because the middle-class perspective in American society is dominant.

- ④ A Distorted Portrait: The Ethnic Minority in Hollywood Films
- ⑤ The Middle-Class Hollywood Hero: A Reflection of Widespread Bias

3. (A), (B), (C)의 각 네모 안에서 어법에 맞는 표현으로 가장 적절한 것은?

Words and actions are objective; perspectives, recollections, and interpretations vary even at the best of times. Ask witnesses to a crime to recount what happened, and you likely will get as many variations as there are witnesses. No one sees the entire picture, especially in conflict, (A) where / which emotions produce tunnel vision. To broaden our perspective, we need to encourage the other person (B) share / to share their story. What happened from their perspective? We may uncover information that helps us make sense of what otherwise seemed irrational or hurtful behavior. As (C) challenged / challenging as it may be to entertain the possibility of a different perspective on our conflicts, it is even more difficult to muster the self-control to hear another's story without correcting or disputing it.

- ① where share challenged
- ② where to share challenging
- ③ where to share challenged
- ④ which share challenging
- ⑤ which to share challenged

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은? (3점)

In 2013, when Latanya Sweeney, a Harvard professor, was searching her name in Google, she found an ad automatically appearing with the wording: "Latanya Sweeney, Arrested? 1) Enter name and state 2) Access full background. Checks instantly, www.instantcheckmate.com." The people who built that system, which used machine learning to match a user's intent with targeted advertising, encoded (a) ① bias right into it. The AI powering Google's AdSense determined that "Latanya" was a Black-identifying name, and people with Black-identifying names more commonly appeared in police databases, therefore there was a strong likelihood that the user might be searching for an arrest record. Curious about what she'd just seen, Sweeney undertook a series of rigorous studies to see if there was evidence of structural racism within online advertising. Her hunch turned out to be (b) ② correct. No one at Google built this system to intentionally discriminate against Black people. Rather, it was built to achieve speed and scale. In the 1980s, a company would meet with an agency, whose human staff would develop ad content—it required a lot of people who all expected to get paid. We've eliminated the people and now assign that work to algorithms, which automate the back-and-forth and deliver (c) ③ better results than the people could on their own. That worked well for everyone except Sweeney. With the scope of humanity (d) ④ extended, the AI system got trained using an initial set of instructions from programmers. The data set most likely included lots of tags, including gender and race. Google makes money when users click through ads—so there's a commercial incentive to (e) ⑤ optimize the AI for clicks. Someone along the way probably taught the system to categorize names into different buckets, which resulted in later databases segregated into racially identifying names.

To say that some languages may be considered more successful than others does not justify linguistic profiling, although this can occur when one language in an area is deemed more prestigious than another. ① Such valuation may easily lead to language prejudice and result in an irrational attitude of superiority toward an individual, a group, or a population using that language. ② And strange as it may seem, language prejudice can exist even in situations in which two languages in question have equally long histories and distinguished literary traditions. ③ A case in point may be the attitude of some white Americans toward Puerto Ricans in the eastern United States, where the use of "good" English is associated with political and economic prestige, while Spanish is equated with a lower-class status. ④ This highlights how learning multiple languages can bridge social divides and open up numerous cultural opportunities. ⑤ In other words, languages, dialects, choice of words, and accents become the means by which people are classified and then treated accordingly.

*linguistic profiling: 언어 프로파일링

6. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

The sharpest blades in history were not made of steel. They were crafted thousands of years ago from a naturally occurring material called obsidian. This jet-black mineral forms in the lava flow of active volcanoes. The rapid cooling of this material means it solidifies with very few crystals. It is hard and breakable and therefore breaks into very sharp pieces. In fact, well-crafted obsidian blades are said to be many times sharper than modern surgical scalpels. I know what you're thinking, "If obsidian's so great, how come doctors don't make scalpels out of it?" Even though the edge it produces is second to none, obsidian isn't the most durable substance. It chips and loses its edge much more easily than any metal, so it has to be replaced frequently. It's also difficult to mass-produce, unlike metal items that are made from a mold.

Even though obsidian blades are known to be the ____ (A) ____, obsidian is not used to make scalpels because it is ____ (B) ____.

- | (A) | (B) | (A) | (B) |
|-------------------|----------------------|-------------------|---------------------|
| ① sharpest | very expensive | ② sharpest | easily broken |
| ③ sharpest | extremely rare | ④ most affordable | hard to craft |
| ⑤ most affordable | easy to deform | | |
