

2027학년도 수능 대비 모의평가

1. 다음 글의 주제로 가장 적절한 것은?

Many organizations claim to value teamwork, yet their reward systems quietly undermine it. Promotions, bonuses, and public recognition are frequently allocated according to individual output, so employees rationally conclude that visible personal achievement, rather than collective contribution, is what truly advances a career. Under such incentive structures, even well-intentioned workers grow reluctant to share credit, mentor colleagues, or subordinate their own projects to a team's broader goals, since doing so offers no discernible professional advantage. Consequently, collaboration deteriorates not because employees lack goodwill but because the formal metrics of success never acknowledge it. Organizations that have successfully cultivated genuine collaborative cultures share two deliberate practices: they redesign evaluation criteria to weigh group outcomes alongside individual ones, and they systematically identify and reassign or remove members who persistently prioritize self-advancement over shared success, regardless of their individual talent. Only when reward structures explicitly value cooperative behavior, and chronically self-centered members are addressed rather than tolerated, does teamwork evolve from a stated aspiration into an embedded organizational norm.

- ① the overall decline of loyalty toward organizations among younger generations of workers
- ② the psychological reasons why individual employees resist adopting new performance metrics
- ③ the advantages of public recognition programs in motivating high-performing individual employees
- ④ the necessity of aligning reward systems and addressing self-interested members to foster real teamwork
- ⑤ various historical methods companies have used to measure employee productivity over time

2. 다음 글의 제목으로 가장 적절한 것은?

Do you feel better after taking a walk in the park or watching a beautiful sunset? If so, you may be unknowingly using your own form of "ecotherapy," a type of therapy designed to (a) improve emotional health by reconnecting people with nature and the environment. The field of ecopsychology, which first became popular in the United States in the 1990s, claims that humans are an (b) integral part of the natural world and should not be separated from it. Their emotional health may suffer if they are cut off from nature by urbanization or other aspects of modern life. In addition, this alienation may cause emotional and physical (c) comfort. Out of this movement grew ecotherapy, offering strategies to strengthen people's relationship with nature. For instance, learning to survive alone in the wilderness can build confidence, but even a simple walk outdoors can also be effective. Some therapies involve animals: swimming with dolphins, playing with your pet, or watching a tropical fish tank are all (d) beneficial. Even looking at a picture of an outdoor scene can help. As a result, one UK mental health charity is now proposing that ecotherapy be made more (e) readily available for mental health patients, as it already is in Holland and Norway. So if you're feeling a bit down, you may not need antidepressants or costly therapy. First, try riding your bike or walking on the beach. These activities will surely be good for your physical health, and may strengthen your spirits, too.

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Speculations about the meaning and purpose of prehistoric art ① rely heavily on analogies drawn with modern-day hunter-gatherer societies. Such primitive societies, ② as Steven Mithen emphasizes in *The Prehistory of the Modern Mind*, tend to view man and beast, animal and plant, organic and inorganic spheres, as participants in an integrated, animated totality. The dual expressions of this tendency are anthropomorphism (the practice of regarding animals as humans) and totemism (the practice of regarding humans as animals), both of ③ which spread through the visual art and the mythology of primitive cultures. Thus the natural world is conceptualized in terms of human social relations. When considered in this light, the visual preoccupation of early humans with the nonhuman creatures ④ inhabited their world becomes profoundly meaningful. Among hunter-gatherers, animals are not only good to eat, they are also good to think about, as Claude Lévi-Strauss has observed. In the practice of totemism, he has suggested, an unlettered humanity "broods upon ⑤ itself and its place in nature."

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

In 1914, Ford introduced an innovation: the \$5 workday. This might not seem like much today, but back then \$5 was about twice the going wage. It was also far ① above the wage that balanced supply and demand. When the new \$5-a-day wage was announced, long lines of job seekers ② formed outside the Ford factories. The number of workers willing to work at this wage far ③ exceeded the number of workers Ford needed. Ford's high-wage policy had many of the effects predicted by the efficiency-wage theory. The rates of leaving jobs and being absent fell, and productivity ④ rose. Workers were so much more efficient that Ford's production costs were lower despite higher wages. Thus, paying a wage above the equilibrium level was ⑤ unprofitable for the firm.

5. 다음 글에서 전체 흐름과 관계 없는 문장은?

One reason consumers form continuing relationships with companies is their desire to reduce choices. Through relationships, they can simplify information gathering and the entire buying process as well as decrease the risk of dissatisfaction. ① They find comfort in brands that have become familiar through their ongoing relationships with companies. ② Such relationships may lead to more efficient decision making by customers and higher levels of customer satisfaction. ③ Research suggests that getting a new customer costs five times more than retaining a current one. ④ A key benefit to consumers in long-term buyer-seller relationships is the perceived positive value they receive. ⑤ Relationships add value because of increased opportunities for frequent customers to save money through discounts, rebates, and similar offers; via special recognition from the relationship programs; and through convenience in shopping.

6. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

There is a key difference between how humans and other intelligent animals learn. In a very telling experiment done by evolutionary psychologist Mike Tomasello at the Max Planck Institute in Germany, a puzzle box containing a treat is given to a human toddler and a chimpanzee. Neither is able to get the treat out. He then demonstrates a multistep process of pulling and pushing pegs that eventually releases the treat. Among the motions, he includes an obviously nonsensical step — patting his head three times before the last step. Both the toddler and the chimp are able to copy his actions and get the treat, but only the toddler includes the head-patting step. The chimp, seeing this is not relevant to getting the treat, omits it from the routine. The human, however, unquestioningly copies all the steps. The toddler trusts the human teaching her to have a reason for each step in this situation, and so she overcopies. In fact, the less clear the goal of the procedure, the more carefully and precisely the human child will imitate even irrelevant steps.

According to the experiment above, when given multiple steps to get a treat, toddlers ___(A)___ every step of the procedure unlike chimpanzees, because toddlers do not doubt the ___(B)___ of each step.
