1. 다음 글의 주제로 가장 적절한 것은?

Consumers frequently refuse to try a food once it has been labeled with a category they associate with unpleasantness, even when the actual dish varies enormously in preparation and taste. In one restaurant survey, diners who saw a dish listed simply as "organ meat" declined it far more often than those who saw the identical dish described by its specific preparation, such as a delicately seasoned p t . Interestingly, many who refused the labeled version had previously eaten and enjoyed the very same dish under a different name. This pattern suggests that what people are rejecting is not the sensory reality of the food itself, which can range widely in texture, seasoning and presentation, but the category label they have learned to associate with disgust. The label functions as a mental shortcut, collapsing countless distinct experiences into a single negative impression. Once this shortcut is formed, it operates independently of the actual variation hidden beneath it, leading consumers to avoid an entire class of foods rather than evaluating each instance on its own merits.

- ① 레스토랑 메뉴판의 명칭 표기 방식에 대한 규제 필요성
- ② 요리 준비 방식의 다양성이 소비자 만족도를 높이는 이유
- ③ 특정 음식에 대한 혐오가 문화마다 다르게 나타나는 양상
- ④ 사람들이 실제 감각 경험이 아니라 범주 명칭 자체를 거부하는 현상
- ⑤ 역겨움이라는 감정이 미각 경험 전반에 미치는 생리적 영향

2. 다음 글의 제목으로 가장 적절한 것은?

Long space missions face a fundamental resource problem: how to feed a crew without loading a spacecraft with heavy provisions. Addressing this challenge, researchers have developed a protein-rich cookie made from plastic waste. PET plastic, mixed with biomass such as corn stalks, is broken down through a chemical process into simple components that yeast microbes can consume. These microbes, genetically engineered to produce proteins, fats, and flavoring compounds, transform the waste into a nutrient-rich slurry, which is then shaped and cooked into a cookie-like product. While taste-testing approval is still pending, the innovation is not limited to astronauts alone. Given that global food demand is projected to rise sharply while hunger risk grows worldwide, the researchers argue that microbe-based conversion of waste into food could offer a practical solution to feeding people both in space and on Earth.

When you think of your habits, the ones that most readily come to mind are usually the obvious ones, like your morning routine. But remember that close to half of your behavior is habitual, and that applies to your work as much as it ① does to what you do before you arrive at the office. ② How you manage your workday is all to some degree driven by habits – some positive and others negative. If you want to get promoted or ③ make the right strategic decision for your business, you need to have the right habits. But how do you build these habits in the first place? Is it genetics? Early leadership theorists were convinced that some people were genetically gifted with special characteristics that made ④ them more likely to end up in leadership positions. However, twin studies have disproved this notion. When researchers examined the likelihood of twins ⑤ occupied a leadership role, they found that genetic factors accounted for only 30 percent.

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은? (3점)

For thousands of years, scientists and philosophers have been trying to figure out how meaning works. And yet good answers have been hard to come by, much more so than for other aspects of language. The fields of linguistics and psychology have actually made substantial progress in the way that people pronounce and perceive words and the reasons why words in sentences take the particular orders they do. These are aspects of language that are directly (A) measurable / immeasurable – you can tell exactly when a speaker's tongue makes contact with the velum to pronounce a hard k sound. But meaning is comparatively harder, because it's something that you do almost entirely in your mind. As a result, it's (B) invisible / visible to direct inspection such as measuring, counting, or weighing. That makes it hard to bring the usual means of science to bear on it. There's no debating the sizeable potential rewards for learning how meaning works, but for most of human history, despite their appeal, they've (C) escaped / accepted capture. So, although you might expect otherwise, the scientific study of meaning is still in its infancy.

Under difficult economic conditions, consumers tend to control their consumption, especially of luxury goods. ① For instance, starting in 1929, the collapse of the New York stock market led to a worldwide economic depression and mass unemployment that lasted until the late 1930s or early 1940s. ② The event influenced not only the U.S. fashion industry but also the French high-fashion industry, which had been dependent on exports to U.S. retailers. ③ U.S. retailers did not waste any time in opening their doors to customers once the official release date of luxury goods, November 9th had been reached. ④ U.S. department stores canceled their orders, and designers cut their prices and introduced inexpensive ready-to-wear lines. ⑤ The economic decline that began in 2008 has had a similar impact on U.S. consumers, who turned to inexpensive (store) brands, discount retailers, and basic styles for their clothing needs.

6. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

The study of archaeologists often goes beyond helping us better understand our prehistoric past. But the data that archaeologists have at their disposal are very selective. Not only are archaeologists limited to material remains, but also the overwhelming majority of material possessions that may have been part of a culture do not survive thousands of years under the ground. As a result, archaeologists search for fragments of material evidence that will enable them to piece together a culture. A prehistoric garbage dump is particularly revealing, for the archaeologist can learn a great deal about how people lived from what they threw away. These material remains are then used to make inferences about the nonmaterial aspects of the culture being studied. For example, the finding that all women and children are buried with their heads pointing in one direction, whereas the heads of adult males point in a different direction, could lead to the possible explanation that the society practiced matrilineal kinship.
