

2027학년도 수능 대비 모의평가

1. 다음 글의 주제로 가장 적절한 것은?

I recently returned from leading an educational program in Thailand focusing on how Buddhists practice the religion in their day-to-day lives. Many Western Buddhists' practices center on meditation, and I have taught many students in the U.S. who share this narrow understanding. However, as I show in my recent book, Buddhism is more than an intellectual tradition focused on the mind. In countries with a majority Buddhist population, such as Thailand, Buddhist practice involves rituals, offerings to monks and visits to temples. A central part of daily practice is merit-making, such as placing gold leaf on Buddha statues or offering donations connected to one's birth day and year. Another foundational feature is the relationship between monks and laity, in which monks provide spiritual guidance in exchange for alms. These lived, communal practices show that Thai Buddhism is expressed not merely through private contemplation but through concrete daily rituals and social bonds.

- ① Thai Buddhists' emphasis on donating gold leaf to Buddha statues for healing purposes
- ② the universal decline of meditation practice among Buddhists worldwide
- ③ the historical origins of Theravada Buddhism in Southeast Asia
- ④ the negative effects of the COVID-19 pandemic on global religious institutions
- ⑤ the everyday rituals and communal relationships that give practical expression to Buddhism in Thailand

2. 다음 글의 제목으로 가장 적절한 것은?

Why not simply take everything you can get, whenever the opportunity arises? Why not determine to live in that manner? Or is there an alternative, more powerful and more compelling? Our ancestors worked out very sophisticated answers to such questions, but we still don't understand them very well. This is because they are in large part still implicit – appear primarily in ritual and myth, and incompletely expressed. We act them out and represent them in stories, but we're not yet wise enough to formulate them explicitly. We're still chimps in a troupe, or wolves in a pack. We know how to behave. We know who's who, and why. We've learned that through experience. Our knowledge has been shaped by our interaction with others. We've established predictable routines and patterns of behavior but we don't really understand them, or know where they originated. They've evolved over great expanses of time. No one was formulating them explicitly even though we've been telling each other how to act forever.

- ① Knowledge Can't Exist Until It Can Be Expressed
- ② Greed: One of the Most Powerful Human Emotions
- ③ Our Values Developed Before We Fully Understood Them
- ④ Using Myths to Pass Lessons on to the Next Generation
- ⑤ Understanding Human Behavior: Predictions Do Matter

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

In some cases two species are so dependent upon each other ① that if one becomes extinct, the other will as well. This nearly happened with trees that ② relied on the now-extinct Dodo birds. They once roamed Mauritius, a tropical island ③ situating in the Indian Ocean. However, Dodo birds became extinct during the late 19th century. They were overhunted by humans and other animals. After they ④ disappeared, the Calvaria Tree soon stopped sprouting seeds. Scientists finally concluded that, for the seeds of the Calvaria Tree ⑤ to sprout, they needed to first be digested by the Dodo bird.

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은? (3점)

Plant growth is controlled by a group of hormones called auxins found at the tips of stems and roots of plants. Auxins produced at the tips of stems tend to accumulate on the side of the stem that is in the shade. Accordingly, the auxins ①stimulate growth on the shaded side of the plant. Therefore, the shaded side grows faster than the side facing the sunlight. This phenomenon causes the stem to bend and appear to be growing ②towards the light. Auxins have the ③opposite effect on the roots of plants. Auxins in the tips of roots tend to limit growth. If a root is horizontal in the soil, the auxins will accumulate on the lower side and interfere with its development. Therefore, the lower side of the root will grow ④faster than the upper side. This will, in turn, cause the root to bend ⑤downwards, with the tip of the root growing in that direction.

5. 다음 글에서 전체 흐름과 관계 없는 문장은?

Findings from several studies on nonpatient groups such as university students suggest that simply looking at everyday nature, as compared to built scenes that lack nature, is significantly more effective in promoting restoration from stress. ① One early study focused on students who were experiencing mild stress because of a final course exam. ② A self-ratings questionnaire was used to assess restorative influences of viewing either a diverse slide sample of unblighted built settings lacking nature, or slides of undistinguished nature settings dominated by green vegetation. ③ Results suggested that the nature views fostered greater psychological restoration as indicated by larger reductions in negative feelings such as fear and anger/ aggression and much higher levels of positive feelings. ④ The new-made views of concrete jungle selected to target these feelings directly helped to create an environment offering stress restoration. ⑤ Also, the scenes with vegetation sustained interest and attention more effectively than did the urban scenes without nature.

6. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

A few scientists from Duke University and University College London decided to find out what happens inside our brains when we lie. They put people into an fMRI scanner and had them play a game where they lied to their partner. The first time people told a lie, the amygdala weighed in. It released chemicals that give us the familiar, but sickening, sense of guilt we get when we lie. But then the researchers went one step further. They rewarded people for lying. They gave them a small monetary reward for deceiving their partner without them knowing they'd been lied to. Once people started getting rewarded for lying and not getting caught, that amygdaladriven sense of guilt started to fade. More interestingly, the less our brain is bothered by the lies, the bigger the lies we tell. So people started telling bigger and bigger lies. Despite being small at the beginning, engagement in dishonest acts may trigger a process that leads to larger acts of dishonesty later on.

The experiment above suggests that when people tell lies, their brain chemistry changes, affecting their feelings of (A) and leading them to tell (B) lies.

- | (A) | (B) | (A) | (B) |
|-----------|------------------|-----------|------------------|
| ① prize | bigger | ② guilt | harsher |
| ③ guilt | bigger | ④ benefit | preventing |
| ⑤ penalty | inhibiting | | |
