When trying to establish what is meant by digital preservation, the first question that must be addressed is: what are you actually trying to preserve? This is clear in the analog environment where the information content is inextricably fixed to the physical medium. In the digital environment, the medium is not part of the _____. A bit stream looks the same to a computer regardless of the media it is read from. A physical carrier is necessary, but as long as the source media can be read, bit-perfect copies can be made cheaply and easily on other devices, making the preservation of the original carrier of diminishing importance. As the physical media that carry digital information are quite delicate relative to most analog media, it is expected that digital information will necessarily need to be migrated from one physical carrier to another as part of the ongoing preservation process. It is not the media itself but the information on the media that needs to be preserved.

There is something deeply paradoxical about the professional status of sports journalism, especially in the medium of print. In discharging their usual responsibilities of description and commentary, reporters' accounts of sports events are eagerly consulted by sports fans, while in their broader journalistic role of covering sport in its many forms, sports journalists are among the most visible of all contemporary writers. The ruminations of the elite class of 'celebrity' sports journalists are much sought after by the major newspapers, their lucrative contracts being the envy of colleagues in other 'disciplines' of journalism. Yet sports journalists do not have a standing in their profession that corresponds to the size of their readerships or of their pay packets, with the old saying (now reaching the status of cliché) that sport is the 'toy department of the news media' still readily to hand as a dismissal of the worth of what sports journalists do. This reluctance to take sports journalism seriously produces the paradoxical outcome that sports newspaper writers are much read but little _____.

There are a number of human resource management practices that are necessary to support organizational learning.

- (A) Their role should be to assist, consult, and advise teams on how best to approach learning. They must be able to develop new mechanisms for cross-training peers team members and new systems for capturing and sharing information. To do this, human resource development professionals must be able to think systematically and understand how to promote learning within groups and across the organization.
- (B) For example, performance evaluation and reward systems that reinforce long-term performance and the development and sharing of new skills and knowledge are particularly important. In addition, the human resource development function may be dramatically changed to keep the emphasis on continuous learning.
- (C) In a learning organization, every employee must take the responsibility for acquiring and transferring knowledge. Formal training programs, developed in advance and delivered according to a preset schedule, are insufficient to address shifting training needs and encourage timely information sharing. Rather, human resource development professionals must become learning facilitators. 3점

A firm is deciding whether to invest in shipbuilding. If it can produce at sufficiently large scale, it knows the venture will be profitable.

- (A) There is a "good" outcome, in which both types of investments are made, and both the shipyard and the steelmakers end up profitable and happy. Equilibrium is reached. Then there is a "bad" outcome, in which neither type of investment is made. This second outcome also is an equilibrium because the decisions not to invest reinforce each other.
- (B) Assume that shipyards are the only potential customers of steel. Steel producers figure they'll make money if there's a shipyard to buy their steel, but not otherwise. Now we have two possible outcomes what economists call "multiple equilibria."
- (C) But one key input is low-cost steel, and it must be produced nearby. The company's decision boils down to this: if there is a steel factory close by, invest in shipbuilding; otherwise, don't invest. Now consider the thinking of potential steel investors in the region.

If not, the robot might endlessly chase itself rather than the blocks.

People involved in the conception and engineering of robots designed to perceive and act know how fundamental is the ability to discriminate oneself from other entities in the environment. Without such an ability, no goal-oriented action would be possible. (①) Imagine that you have to build a robot able to search for blocks scattered in a room in order to pile them. (②) Even this simple task would require that your machine be able to discriminate between stimulation that originates from its own machinery and stimulation that originates from the blocks in the environment. (③) Suppose that you equip your robot with an artificial eye and an artificial arm to detect, grab, and pile the blocks. (④) To be successful, your machine will have to have some built-in system enabling it to discriminate between the detection of a block and the detection of its own arm. (⑤) Your robot would engage in circular, self-centered acts that would drive it away from the target or external goal.

On top of the hurdles introduced in accessing his or her money, if a suspected fraud is detected, the account holder has to deal with the phone call asking if he or she made the suspicious transactions.

Each new wave of technology is intended to enhance user convenience, as well as improve security, but sometimes these do not necessarily go hand-in-hand. For example, the transition from magnetic stripe to embedded chip slightly slowed down transactions, sometimes frustrating customers in a hurry. (①) Make a service too burdensome, and the potential customer will go elsewhere. (②) This obstacle applies at several levels. (③) Passwords, double-key identification, and biometrics such as fingerprint-, iris-, and voice recognition are all ways of keeping the account details hidden from potential fraudsters, of keeping your data dark. (④) But they all inevitably add a burden to the use of the account. (⑤) This is all useful at some level indeed, it can be reassuring knowing that your bank is keeping alert to protect you but it becomes tiresome if too many such calls are received.
