

2027학년도 수능 대비 모의평가

1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Plato held that the goal of the rational person was the cultivation of personal virtue (or excellence) and happiness. In his view, such a person knows what is true by pure reason, can control the desires, and ① capable of both philosophy and command. The ideal ruler in the Platonic state is its best philosopher. Some of the virtues that Plato put forward ② were temperance, courage, wisdom, and justice. Aristotle, on the other hand, emphasized ③ those of friendship, pride, and moderation. Today, it is easy to underestimate the importance to these teachers of human reasoning and the spoken word (logos) they used ④ to convey that reasoning by way of argument. The logos of reasoned argument was not just a symbol or even just a conveyer of meaning; it was the very substance of knowledge itself. Logos made reasoned discourse possible; it was, therefore, the very stuff of knowledge; it was ⑤ what made one truly human.

The builtin capacity for smiling is proven by the remarkable observation ① that babies who are congenitally both deaf and blind, who have never seen a human face, also start to smile at around 2 months. However, smiling in blind babies eventually ② disappears if nothing is done to reinforce it. Without the right feedback, smiling dies out. But here's a fascinating fact: blind babies will continue to smile if they are cuddled, bounced, nudged, and tickled by an adult anything to let ③ them know that they are not alone and that someone cares about them. This social feedback encourages the baby to continue smiling. In this way, early experience operates with our biology ④ to establish social behaviors. In fact, you don't need the cases of blind babies to make the point. Babies with sight smile more at you when you look at them or, better still, ⑤ smiling back at them.

*congenitally: 선천적으로 **cuddle: 껴안다 ***nudge: 팔꿈치로 쿡쿡 찌르다

Some researchers assumed early human beings ate mainly the muscle flesh of animals, as we ① do today. By "meat," they meant the muscle of the animal. Yet focusing on the muscle appears to be a ② relatively recent phenomenon. In every history on the subject, the evidence suggests that early human populations ③ preferred the fat and organ meat of the animal over its muscle meat. Vihjalmur Stefansson, an arctic explorer, found that the Inuit were careful to save fatty meat and organs for human consumption ④ while giving muscle meat to the dogs. In this way, humans ate as other large, meateating mammals eat. Lions and tigers, for instance, first eat the blood, hearts, livers, and brains of the animals they kill, often ⑤ leave the muscle meat for eagles. These organs tend to be much higher in fat.
