

2027학년도 수능 대비 모의평가

1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? (3점)

Not only are humans ① unique in the sense that they began to use an everwidening tool set, we are also the only species on this planet that has constructed forms of complexity that use external energy sources. This was a fundamental new development, ② which there were no precedents in big history. This capacity may first have emerged between 1.5 and 0.5 million years ago, when humans began to control fire. From at least 50,000 years ago, some of the energy stored in air and water flows ③ was used for navigation and, much later, also for powering the first machines. Around 10,000 years ago, humans learned to cultivate plants and ④ tame animals and thus control these important matter and energy flows. Very soon, they also learned to use animal muscle power. About 250 years ago, fossil fuels began to be used on a large scale for powering machines of many different kinds, thereby ⑤ creating the virtually unlimited amounts of artificial complexity that we are familiar with today.

Rising eagles have the incredible ability to see mice ① move in the grass from a mile away. Similarly, cats have the amazing ability to see even in very dim light, thanks to special "reflectors" ② which are at the back of their eyes. Through natural selection over time, each species has developed a visual system uniquely adapted to ③ its way of life. Humans can see objects near and far with great sensitivity and sharpness during the day and night. Our night vision is not as ④ sharply as that of some animals, but our color vision is excellent. That is not a bad tradeoff because being able to appreciate a beautiful sunset ⑤ seems worth an occasional stumble in the dark.

Despite abundant warnings that we shouldn't measure ourselves against others, most of us still do. We're not only meaning-seeking creatures but social ① ones as well, constantly making interpersonal comparisons to evaluate ourselves, improve our standing, and enhance our self-esteem. But the problem with social comparison is that it often backfires. When comparing ourselves to someone who's doing better than we are, we often feel ② inadequate for not doing as well. This sometimes leads to what psychologists call malignant envy, the desire for someone ③ to meet with misfortune ("I wish she didn't have what she has"). Also, comparing ourselves with someone who's doing worse than we are ④ risk scorn, the feeling that others are something undeserving of our beneficence ("She's beneath my notice"). Then again, comparing ourselves to others can also lead to benign envy, the longing to reproduce someone else's accomplishments without wishing them ill ("I wish I had what she has"), ⑤ which has been shown in some circumstances to inspire and motivate us to increase our efforts in spite of a recent failure.
