

2027학년도 수능 대비 모의평가

1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Childrens antennae are constantly tuned to the way their parents, particularly their mothers, talk about causes of emotionally loaded events. It is no accident that Why? is one of the first and most repeated questions that young children ask. Getting explanations for the world around them, particularly the social world, been the prime intellectual task of growing up. Once the parents get impatient and stop answering the never-ending why questions, children get their answers in other ways. Mostly they listen closely when you spontaneously explain why things happen – which you do, on average, about once a minute during speech. Your children hang on every word of the explanations you give, particularly when something goes wrong. Not only do they listen for the particulars of what you say, but they listen keenly to its formal properties: whether the cause you cite is permanent or temporary, specific or general, your fault or someone elses.

- ① emotionally
- ② that
- ③ been
- ④ which
- ⑤ do they listen

2. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? (3점)

Psychologists who study giving behavior ① have noticed that some people give substantial amounts to one or two charities, while others give small amounts to many charities. Those who donate to one or two charities seek evidence about what the charity is doing and ② what it is really having a positive impact. If the evidence indicates that the charity is really helping others, they make a substantial donation. Those who give small amounts to many charities are not so interested in whether what they are ③ doing helps others — psychologists call them warm glow givers. Knowing that they are giving makes ④ them feel good, regardless of the impact of their donation. In many cases the donation is so small — 10 or less — that if they stopped ⑤ to think, they would realize that the cost of processing the donation is likely to exceed any benefit it brings to the charity.

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? (3점)

Anatomically modern humans have lived on the planet for almost 200,000 years. That means your officemate who sits on a rolling chair beneath fluorescent lights ① has pretty much the same basic body as the prehistoric caveman who made spear points to hunt antelope. To get from there to here, humans faced countless challenges as they fled predators, froze in snowstorms, sought shelter from the rain, and ② hunted their food. Until very recently, there was never a time when comfort could ③ be taken for granted – there was always a balance between the effort they expended and the result they earned. For the bulk of that time, they achieved these feats without ④ what anyone today would consider as modern technology. Instead, they had to be strong enough to survive. If your officemate had the ability to travel back in time and meet one of his prehistoric ancestors, ⑤ which would be a very bad idea for him to challenge that caveman to a wrestling match.
