

2027학년도 수능 대비 모의평가

1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Hospices are a special type of healthcare institution. Hospices treat patients suffering from incurable diseases ① which are not expected to live for more than a year. Hospitals, however, aim to help patients ② recover from disease, and nursing homes provide long term care for the handicapped and elderly. Also, the hospices purpose is to help ③ the dying and their families. In contrast, hospitals and nursing homes have limited resources for helping patients families. Therefore, unlike hospital, hospice is end of life care. It ④ consists of medical services which dont try to cure the disease or medical condition, but basically help the patient live as comfortable as possible ⑤ despite the condition as long as the patient is alive or availing the hospice care. It is provided to terminally ill or elderly patients.

Lectins are large proteins that serve as a crucial weapon that plants use to defend ① themselves. The lectins in most plants bind to carbohydrates as we consume the plant. They also bind to sugar molecules ② found in the gut, in the brain, between nerve endings, in joints and in all bodily fluids. According to Dr. Steven Gundry, these sticky proteins can interrupt messaging between cells and ③ cause toxic and inflammatory reactions. Brain fog is just one result of lectins interrupting communication between nerves. An upset stomach is another common symptom of lectin overload. Dr. Gundry lists a wide range of other health problems including aching joints, dementia, headaches and infertility ④ that have been resolved in his patients once they eliminated lectins from their diets. Dr. Paul Saladino writes that the hypothesis that lectins are involved in Parkinson's disease is also gaining support, with animal studies ⑤ showed that 'lectins, once eaten, may be damaging the gut and travelling to the brain, where they appear to be toxic to dopaminergic neurons'.

*inflammatory: 염증성의

There is little doubt that we are driven by the sell-by date. Once an item is past that date it goes into the waste stream, further ① increasing its carbon footprint. Remember those items have already travelled hundreds of miles ② reach the shelves and once they go into waste they start a new carbon mile journey. But we all make our own judgement about sell-by dates; those brought up during the Second World War ③ are often scornful of the terrible waste they believe such caution encourages. The manufacturer of the food has a view when making or growing something ④ that by the time the product reaches the shelves it has already been travelling for so many days and possibly many miles. The manufacturer then decides that a product can reasonably be consumed within say 90 days and 90 days minus so many days for travelling gives the sell-by date. But ⑤ whether it becomes toxic is something each individual can decide. It would seem to make sense not to buy large packs of perishable goods but non-perishable items may become cost-effective.

*sell-by date: 판매 유효 기한 **scornful: 경멸하는
