Language can be used to describe both brute reality and social reality, but the tools it uses to do so — essentially, word meanings — are bits of social reality in the classic sense. The line between my property and my neighbors property has the meaning it has because linguistic acts have made it so, and we all agree to abide by those acts. In other words, my property is mine because we all agree that it is, and we act in accordance with that agreement. If my neighbor trespasses on my property, she will not be surprised if, when caught, I am surprised at her actions and may even want to hold her to account. In the same way, the English words dog, table, and walk refer to the things they do because we agree that they do, or at least we act as if we had made such an agreement. We similarly anticipate that others will be surprised and even disposed to sanction us if we fail to keep to that agreement (for example, by using the word dog to refer to a cat).

- ② technical words for property, meaning, and agreement
- ③ languages status as a system beyond human influence
- ④ language that exists independent of social agreement

The economic benefit of culturtainment makes it attractive to politicians and policy makers alike. A potential increase in inbound visitor numbers coupled with their demand for related goods and services (travel, accommodation, retail) is an incentive for those within governments and authorities to work with cultural groups in order to develop celebrations and commemorations into larger and more high-profile events. However, such commercialization risks culturtainment becoming homogeneous and losing its original 'message' that could lead to a dilution of audiences. This could also lead to smaller non-commercial independent events being set up that would only serve to divide audiences further. This is something that planners and stakeholders will need to balance against potential financial gain. Changing political, social and religious landscapes will lead to the emergence of new cultures, and with them new culturtainment experiences. Overall this is a healthy growth sector of the entertainment industry, but one that by its very nature is delicate in the face of exploitation.

Fashion is always deeply cultural, and an excellent example of this can be seen in the evolution of European clothing. At the beginning of the Middle Ages, clothing tended to be simple and was ① frequently made of rough wool or animal furs. With advances in cloth making, however, fashion began moving toward styles ② what were more elaborate and form-fitting. In the Renaissance and Elizabethan eras, styles became even more refined. The clothes that wealthy people were wearing became increasingly fancier, with a particular emphasis being placed on smaller waists. The connection between clothing and social status was so pronounced that laws were enacted ③ to limit the wearing of certain luxury items. ④ Allowed only for higher social classes, luxurious styles and decorations such as feathers, silk, or velvet were used as a means of demonstrating one's standing in society. This was further reinforced as upperclass styles came to be explicitly incorporated into cultural ceremonies so that ⑤ their wearers' roles could be identified clearly.

Wildfire is a natural phenomenon in many ecosystems. Indeed both the climate and vegetation can combine to make some ecosystems particularly flammable. We should not, therefore, consider all fires 'bad' and ① requiring to be extinguished. Frequent low-intensity surface fires in some forested ecosystems may reduce surface fuel loads and help prevent the development of more dangerous crown fires. In some cases the ② accidental setting of surface fires may be useful, and it is a practice long carried out by several indigenous populations across the world. In other cultures prescribed burning may be an option to ③ prevent the occurrence of more dangerous fires. Even so, it is not without risk, as the fire may 'escape' from a ④ managed prescribed surface burn to an out-of-control wildfire, especially if the weather changes unexpectedly. Nevertheless, it is unfortunate that misunderstanding of prescribed burning has led in some cases to public and governmental ⑤ rejection of such a practice.

All workers need access to mentors that can provide them with valuable information about their job, their workplace, and the resources that are available within their organization. Mentors also provide much needed psychosocial support. ① Having a diverse network of mentors is important for dominant and minority group members alike. ② Minority group members need diverse mentors so that they can gain insight into what it means to be employed by a particular organization or in a particular field or profession. ③ Majority workers benefit by having a network of diverse mentors because it increases their understanding and sensitivity to the unique realities of diverse workers and their own identity, and perhaps even their own forms of privilege. ④ Mentoring has been typically required and praised as an essential component in the personal development of employers. ⑤ The ultimate goal of these mentoring opportunities is to have individuals be more informed, identified, and engaged in their work and in their organization.

Digital sustainability usually relates to eco-conscious practices that involve modifying existing systems or implementing new strategies to align with sustainability objectives, like reducing carbon emissions, optimizing energy efficiency, and minimizing electronic waste. These can be costly modifications, especially when sustainability goals relate to large-scale communications and data infrastructures. Too often, initiatives to green or render more sustainable a particular infrastructure are measured against the profit the industry generates in its current state. If the industry is profitable — as cloud computing is — it might lack incentive to change because there are significant financial costs associated with achieving sustainability goals. This explains why sustainability goals are often pushed into the future — usually at least a decade or so — to delay costs against profit. This also explains why sustainability goals become (economic) discursive distractions, perpetual promises of something better, while little (materially) changes.

The push for greener practices in technology is often ____ (A) ____ by profit-driven motives, leading to promises of change that are ____ (B) ____ .
