1. 다음 글의 주제로 가장 적절한 것은?

Humans currently spend about \$750 billion a year on meat — the idea is that there's plenty of opportunity to slice into that market share. But the massive global meat industry isn't particularly keen to step aside and make room for new market entrants. The powerful cattlemen's lobby has exercised much influence to ensure that they play a role in shaping just how cultured meat will be regulated, while many of their members laugh at the product by calling it "fake meat." Initially, it was the science that kept cultured meat products from the market. Making cultured meat was just too expensive and the technology wasn't able to produce foods that were analogous to conventional products. But as the start-ups got better at their craft and the quality of their products improved, the biggest barrier to the market changed. It's a difficult regulatory landscape that's become the chief obstacle stopping people from getting cultured meat into markets around the globe and in front of consumers.

- ① the main problem with cultured meat's reaching consumers
- ② government opposition to standard meat industry regulations
- ③ influence of "fake meat" in the annual global tech conference
- ④ the reason for the negative public opinion to cultured meat
- ⑤ the function of lobbying for increasing meat consumption

2. 다음 글의 제목으로 가장 적절한 것은?

Bringing in an outside expert to support a proposal or decision can, at times, provide managers with some of the same benefits that the use of objective information does. It lends credibility to a managers initiatives and causes others to believe that what the manager is proposing is the appropriate or rational thing to do. Although you might think consultants and other outside experts are neutral or objective, they sometimes are hired by managers who want them to support a certain position or decision in an. organization. For instance, when managers face strong opposition from others who fear that a decision will harm their interests, the managers may bring in an outside expert. They hope this expert will be perceived as a neutral observer to lend credibility and objectivity to their point of view. The support of an outside expert may cause others to believe that a decision is indeed the right one. It is an illusion that consultants and other outside experts are always brought into organizations to be objective and guide managers on the appropriate course of action.

- ① The Perceived Objectivity of Consultants in Persuading CEOs
- ② Managerial Knowhow: The Strategic Use of External Expertise
- ③ The Role of Outside Experts: Preventing Irrational Decision-Making
- ④ Why Is Neutral Advice Critical to Achieving Effective Innovation?
- ⑤ Managerial Challenges: Overcoming Conflicts in an Organization

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Honey can be eaten by itself or mixed with other ingredients. Natural or pure honey has had no additives, preservatives or synthetic ingredients added. Also ①referred to as 'undiluted', it is usually more expensive than diluted honeys. Natural honey can also be called 'blended honey', ②which honeys from various sources are blended together — not by the bees, but by human processors and distributors in stages after the honey has been collected. Blending is frequently done for taste as well as marketing reasons, especially since some consumers find the darker honeys too ③strong. Mixing different types of honey together can make it more palatable, and also gives a more uniform flavour — this is an important consideration for producers and retailers, who ④feel the need to guarantee reliable, unsurprising (typically mild) flavours to their customers. Clover is one of the most popular honeys in the U.S., and ⑤its mild flavour and taste have become familiar to many Americans.

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은? (3점)

There is good news about pests and medicinal herbs: Most herbs either repel pests or attract beneficial insects that help keep pest populations in check. So the more herbs you grow, the more you will attract pollinators and "good" bugs that like to eat the more ①destructive pests, which will lead to a more successful garden! When it comes to managing pests in the garden, it's important to remember that you are ②altering the ecosystem of an area that existed on its own before you planted anything into it. So the first couple years in a new garden can feel like wave after wave of pests are ③overtaking your plants. This is normal. The goal of a long-term healthy garden is to work with the environment you are trying to cultivate to ④allow the plants, pollinators, and even the annoying pests to balance out. Immediately attempting to remove a new pest entirely from your garden will only further these initial imbalances and ⑤shorten the process of helping your garden grow better on its own.

*repel: 쫓아버리다 **pollinator: 꽃가루 매개자

5. 다음 글에서 전체 흐름과 관계 없는 문장은?

The idea of connecting a bicycle to a turbine that then converts the energy a person puts into the bike while riding it to some amount of energy is a creative way to harvest personal energy. ① Since bicycles, including stationary bicycles, already have parts rotating about an axle, it is not hard to adapt them to a turbine and a generator to produce electricity. ② Some bicycles now come with GPS tracking features to help users monitor their riding routes and distances. ③ This bicycle-to-energy idea has a certain appeal to people, and there have been attempts, some of them successful, to install such equipment in homes, sometimes a type of rack upon which a bicycle can be mounted and ridden. ④ One can debate how useful this type of energy harvesting is, but the appeal is often to become more self-sustaining as a household, while at the same time engaging in physical exercise more on a daily basis. ⑤ Using a stationary bicycle or a bicycle in a support rack becomes a form of exercise and at the same time a means of harvesting energy.

6. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

Alarm calls were long thought to be simple instinctive responses to danger, a pre-scripted form of communication, wired into the genetic makeup of an animal. This refers to a view of non-human animals who act solely on instinct and who are not capable of responding intelligently. As ethological research in which animals are studied in their own habitats progresses, along with technological developments, it has been found that in many species, like the prairie dog, alarm calls are actually very complex. They should be seen as expressions of an individual animals intelligence rather than as simple mechanistic reactions: as language, rather than as communication. A single call from a prairie dog shares a large amount of information with others in a much more precise and efficient way than a human scream or word. The language of the prairie dog seems to have a similar structure to human language, including grammar; it might also have functions we cannot yet understand because we do not recognize or perceive them.

*ethological: 동물 행동학적

Once thought to be ____ (A) ____ reactions, alarm calls are now understood as complex expressions of intelligence that resemble structured language rather than simple communication and ____ (B) ____ precise details very well.

- | (A) | (B) | (A) | (B) |
|---------------|---------------|---------------|---------------|
| ① inherent | mask | ② rational | deliver |
| ③ intentional | express | ④ instinctive | convey |
| ⑤ innate | screen | | |
