

## 2027학년도 수능 대비 모의평가

### 1. 다음 글의 주제로 가장 적절한 것은? (3점)

The transition to an agricultural society was a remarkable and puzzling behavioral adaptation. After the peak of the last glaciation, people herded gazelles in Syria and Israel. Relying on these herds for food required less effort than planting, weeding, and tending domesticated crops. Similarly, in Central America several hours spent gathering wild corn could provide food for a week. If agriculture was more difficult and time-consuming than hunting and gathering, why did people take it up in the first place? Increasing population density provides an attractive explanation for the origin and spread of agriculture. When hunting and gathering groups grew beyond the capacity of their territory to support them, part of the group would split off and move to new territory. Once there was no more productive territory to colonize, growing populations developed more intensive (and time-consuming) ways to extract a living from their environment. Such pressures favored groups that could produce food themselves to get more out of the land.

- ① why ancient farming techniques developed at such a slow pace
- ② the advantages of raising animals rather than growing crops
- ③ effects of overcrowding and limited space on people becoming farmers
- ④ the mysterious behavioral patterns that resulted in climate changes
- ⑤ reasons for ancient groups to split off from their farming communities

Researchers have considered how users often give their computers person-like attributes. In my fieldwork in anthropology, the technologies in frequent use were not anthropomorphized in any obvious way. But they were frequently the subject of lectures, discussions, and complaints. Perhaps too fancifully, I often imagined them as only partially domesticated beasts. I imagined the EEG(electroencephalograph) as a many-armed sea creature whose tentacles gently felt the scalp and reported electrical activity, the fMRI(functional magnetic resonance imaging) as a roaring, wide-mouthed creature who swallowed and digested subjects inside a magnetic field. To be sure, researchers frequently talked about these tools as disobedient prone to randomly detaching from the subject or stopping for no reason. The technologies also were commonly seen as "speaking" to researchers in a sense. They gave signals, which had to be interpreted, "cleaned," or "read." One common way researchers interacted with these technologies was to delimit their capacities as tools to say what EEG, fMRI, and behavioral tasks can tell us about cognitive processes, and what they can't.

Bad lighting can increase stress on your eyes, as can light that is too bright, or light that shines ① directly into your eyes. Fluorescent lighting can also be ② tiring. What you may not appreciate is that the quality of light may also be important. Most people are happiest in bright sunshine — this may cause a release of chemicals in the body ③ that bring a feeling of emotional wellbeing. Artificial light, which typically contains only a few wavelengths of light, ④ do not seem to have the same effect on mood that sunlight has. Try experimenting with working by a window or ⑤ using full spectrum bulbs in your desk lamp. You will probably find that this improves the quality of your working environment.

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

Everyone knows a young person who is impressively "street smart" but does poorly in school. We think it is a waste that one who is so (A) intelligent / unintelligent about so many things in life seems unable to apply that intelligence to academic work. What we don't realize is that schools and colleges might be at fault for missing the opportunity to draw such street smarts and guide them toward good academic work. Nor do we consider one of the major reasons why schools and colleges (B) accept / overlook the intellectual potential of street smarts: the fact that we associate those street smarts with anti-intellectual concerns. We associate the educated life, the life of the mind, too (C) narrowly / widely with subjects and texts that we consider inherently weighty and academic.

5. 다음 글에서 전체 흐름과 관계 없는 문장은? (3점)

Science is a process for producing knowledge. The process depends both on making careful observations of phenomena and on inventing theories for making sense out of those observations. ① Change in knowledge is inevitable because new observations may challenge prevailing theories. ② No matter how well one theory explains a set of observations, it is possible that another theory may fit just as well or better, or may fit a still wider range of observations. ③ In science, the testing and improving and occasional discarding of theories, whether new or old, go on all the time. ④ Some scientists believe that through the use of the intellect, and with the aid of instruments that extend the senses, people can discover patterns in all of nature. ⑤ Scientists assume that even if there is no way to secure complete and absolute truth, increasingly accurate approximations can be made to account for the world and how it works.

6. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은? (3점)

Based on such examples as Coke is it!, some critics claim that much of advertising is only persuasive rather than informative. They claim that there is no information in such an advertising slogan; there is only hoopla in an attempt to persuade a poor consumer to part with his cash. Someone else, however, may find the advertising to be of value. For any one person most advertising is in fact not directed at him. Many of us will agree that the above slogan is lacking in information — what's the price?, where can it be bought?, what's the nutritional content?, etc. But for someone on their way home who has promised to pick up a six pack of Coke for the evening's company the slogan is in fact a welcomed reminder. People are busy with a multitude of activities and cannot keep everything in mind; reminders are often necessary.

\*hoopla 요란한 선전

Although some criticize advertising for its \_\_\_\_\_ (A) \_\_\_\_\_ function, others consider it a \_\_\_\_\_ (B) \_\_\_\_\_ source of information.
