

2027학년도 수능 대비 모의평가

1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은? (3점)

While working as a research fellow at Harvard, B. F. Skinner carried out a series of experiments on rats, using an invention that later became known as a "Skinner box." A rat was placed in one of these boxes, ① which had a special bar fitted on the inside. Every time the rat pressed this bar, it was presented with food. The rate of bar pressing was ② automatically recorded. Initially, the rat might press the bar accidentally, or simply out of curiosity, and as a consequence ③ receive some food. Over time, the rat learned that food appeared whenever the bar was pressed, and began to press ④ it purposefully in order to be fed. Comparing results from rats ⑤ gives the "positive reinforcement" of food for their bar pressing behavior with those that were not, or were presented with food at different rates, it became clear that when food appeared as a consequence of the rat's actions, this influenced its future behavior.

2. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Are cats liquid or solid? That's the kind of question that could win a scientist an Ig Nobel Prize, a parody of the Nobel Prize that honors research that "makes people laugh, then think." But it wasn't with this in mind ① that MarcAntoine Fardin, a physicist at Paris Diderot University, set out to find out whether house cats flow. Fardin noticed that these furry pets can adapt to the shape of the container they sit in ② similarly to what fluids such as water do. So he applied rheology, the branch of physics that deals with the deformation of matter, to calculate the time ③ it takes for cats to take up the space of a vase or bathroom sink. The conclusion? Cats can be either liquid or solid, depending on the circumstances. A cat in a small box will behave like a fluid, ④ filled up all the space. But a cat in a bathtub full of water will try to minimize its contact with it and ⑤ behave very much like a solid.

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Human beings like certainty. This liking stems from our ancient ancestors ① who needed to survive alongside saber-toothed tigers and poisonous berries. Our brains evolved to help us attend to threats, keep away from ② them, and remain alive afterward. In fact, we learned that the more ③ certain we were about something, the better chance we had of making the right choice. Is this berry the same shape as last time? The same size? If I know for certain it ④ is, my brain will direct me to eat it because I know it's safe. And if I'm uncertain, my brain will send out a danger alert to protect me. The dependence on certainty all those millennia ago ensured our survival to the present day, and the danger-alert system continues to protect us. This is achieved by our brains labeling new, vague, or unpredictable everyday events and experiences as uncertain. Our brains then ⑤ generating sensations, thoughts, and action plans to keep us safe from the uncertain element, and we live to see another day.

*saber-toothed tiger: 검치호(검 모양의 송곳니를 가진 호랑이)
