

2027학년도 수능 대비 모의평가

1. 다음 빈칸에 들어갈 말로 가장 적절한 것을 고르시오.

We understand that the segregation of our consciousness into present, past, and future is both a fiction and an oddly self-referential framework; your present was part of your mother's future, and your children's past will be in part your present. Nothing is generally wrong with structuring our consciousness of time in this conventional manner, and it often works well enough. In the case of climate change, however, the sharp division of time into past, present, and future has been desperately misleading and has, most importantly, hidden from view the extent of the responsibility of those of us alive now. The narrowing of our consciousness of time smooths the way to divorcing ourselves from responsibility for developments in the past and the future with which our lives are in fact deeply intertwined. In the climate case, it is not that _____. It is that the realities are obscured from view by the partitioning of time, and so questions of responsibility toward the past and future do not arise naturally.

- ① all our efforts prove to be effective and are thus encouraged
- ② sufficient scientific evidence has been provided to us
- ③ future concerns are more urgent than present needs
- ④ our ancestors maintained a different frame of time
- ⑤ we face the facts but then deny our responsibility

2. 다음 빈칸에 들어갈 말로 가장 적절한 것을 고르시오.

The entrance to a honeybee colony, often referred to as the dancefloor, is a market place for information about the state of the colony and the environment outside the hive. Studying interactions on the dancefloor provides us with a number of illustrative examples of how individuals changing their own behavior in response to local information _____. For example, upon returning to their hive honeybees that have collected water search out a receiver bee to unload their water to within the hive. If this search time is short then the returning bee is more likely to perform a waggle dance to recruit others to the water source. Conversely, if this search time is long then the bee is more likely to give up collecting water. Since receiver bees will only accept water if they require it, either for themselves or to pass on to other bees and brood, this unloading time is correlated with the colony's overall need of water. Thus the individual water forager's response to unloading time (up or down) regulates water collection in response to the colony's need.

- ① allow the colony to regulate its workforce
- ② search for water sources by measuring distance
- ③ decrease the colony's workload when necessary
- ④ divide tasks according to their respective talents
- ⑤ train workers to acquire basic communication patterns

3. 주어진 글 다음에 이어질 글의 순서로 가장 적절한 것은?

Negotiation can be defined as an attempt to explore and reconcile conflicting positions in order to reach an acceptable outcome.

- (A) Areas of difference can and do frequently remain, and will perhaps be the subject of future negotiations, or indeed remain irreconcilable. In those instances in which the parties have highly antagonistic or polarised relations, the process is likely to be dominated by the exposition, very often in public, of the areas of conflict.
- (B) In these and sometimes other forms of negotiation, negotiation serves functions other than reconciling conflicting interests. These will include delay, publicity, diverting attention or seeking intelligence about the other party and its negotiating position.
- (C) Whatever the nature of the outcome, which may actually favour one party more than another, the purpose of negotiation is the identification of areas of common interest and conflict. In this sense, depending on the intentions of the parties, the areas of common interest may be clarified, refined and given negotiated form and substance.

*reconcile: 화해시키다 **antagonistic: 적대적인 ***exposition: 설명

Experts have identified a large number of measures that promote energy efficiency. Unfortunately many of them are not cost effective. This is a fundamental requirement for energy efficiency investment from an economic perspective.

- (A) But the direct cost reductions at the individual level... households can reduce the cost of electricity and gas bills, and improve their health and comfort, while companies can increase their competitiveness and their productivity. Finally, the market for energy efficiency could contribute to the economy through job and firms creation.
- (B) There are significant externalities to take into account and there are also macroeconomic effects. For instance, at the aggregate level, improving the level of national energy efficiency has positive effects on macroeconomic issues such as energy dependence, climate change, health, national competitiveness and reducing fuel poverty.
- (C) However, the calculation of such cost effectiveness is not easy. It is not simply a case of looking at private costs and comparing them to the reduction achieved.

Unfortunately, at the scales, accuracy, and precision most useful to protected area management, the future not only promises to be unprecedented, but it also promises to be unpredictable.

To decide whether and how to intervene in ecosystems, protected area managers normally need a reasonably clear idea of what future ecosystems would be like if they did not intervene. (①) Management practices usually involve defining a more desirable future condition and implementing management actions designed to push or guide ecosystems toward that condition. (②) Managers need confidence in the likely outcomes of their interventions. (③) This traditional and inherently logical approach requires a high degree of predictive ability, and predictions must be developed at appropriate spatial and temporal scales, often localized and near-term. (④) To illustrate this, consider the uncertainties involved in predicting climatic changes, how ecosystems are likely to respond to climatic changes, and the likely efficacy of actions that might be taken to counter adverse effects of climatic changes. (⑤) Comparable uncertainties surround the nature and magnitude of future changes in other ecosystem stressors.

A problem, however, is that supervisors often work in locations apart from their employees and therefore are not able to observe their subordinates' performance.

In most organizations, the employee's immediate supervisor evaluates the employee's performance. (①) This is because the supervisor is responsible for the employee's performance, providing supervision, handing out assignments, and developing the employee. (②) Should supervisors rate employees on performance dimensions they cannot observe? (③) To eliminate this dilemma, more and more organizations are implementing assessments referred to as 360-degree evaluations. (④) Employees are rated not only by their supervisors but by coworkers, clients or citizens, professionals in other agencies with whom they work, and subordinates. (⑤) The reason for this approach is that often coworkers and clients or citizens have a greater opportunity to observe an employee's performance and are in a better position to evaluate many performance dimensions.
