Ever since the early Enlightenment, preservation and conservation have been closely related. Taken as near synonyms, their meaning is to maintain an object or system insofar as possible in its present state, to protect it from change, usually for contemplation, research, display, and perhaps for use. Conservationists who distinguish their activities from preservation emphasize conservation's restorative aspects — restoring a historical musical instrument, for example, or a painting, or a dinosaur, or an ecosystem. Conservationists acknowledge change but try to manage it in order to prolong a(n) _____ state. Preservationists (who may nonetheless call themselves conservationists) think of themselves more as protectors. They sometimes criticize conservationists for setting an additional priority on yield or harvest or use, rather than interfering as minimally as possible in order to preserve the original object or system, as they would do. Preservationists would, for example, prefer to keep a historical musical instrument "as found" in a deteriorated state, for study, rather than to restore or repair it for display or use.

The basic guidelines for good style are not mysterious; in fact, you use them every day in conversation. In conversation and in writing, we all rely heavily on cooperation to make sense of exchanges, and a polished practical style makes cooperation easier. Writers develop such a style by acknowledging that readers expect the same things that listeners expect in conversation: clarity, relevance, and proportion. If you listen to someone who is not clear, who cannot stay on the topic, or who offers too much or too little information, you will quickly lose interest in the conversation. Writers, too, need to be clear, stay on the topic, and give information appropriately. In fact, this attention to audience and appropriateness may be even more important in writing than in conversation because writing does not permit the nonverbal communication and immediate feedback that are part of conversation. As writers, we have to _____; in effect, we have to imagine both halves of a virtual conversation.

- ① recognize the limitations of writing and conversation
- ② envision the reader's preference for stylistic writing
- ③ picture the reader's desire for more knowledge
- ④ develop collaborative writing with readers
- ⑤ anticipate the absent reader's response

Philosophy allows us to ask much broader questions than many other scientific disciplines. It is capable of looking at the bigger picture and providing important insights into the relationships between different areas of knowledge.

- (A) This means that while philosophy can provide valuable insights into theoretical concepts and broader ethical questions, it needs to be supplemented by empirical findings and experiments to reach a more comprehensive understanding.
- (B) Philosophers tend to ask questions rather than provide definitive answers, and their contributions often consist of challenging established assumptions and proposing new research approaches. However, for a more comprehensive understanding of the nature of consciousness, close collaboration between philosophy and neuroscience is required.
- (C) Philosophy is particularly important for the interdisciplinary efforts of cognitive science, where it helps to bridge gaps between different disciplines and pioneer new ways for research. Unlike scientific methods, philosophizing is a non-empirical approach that attempts to validate concepts through logical thinking and argumentation.

If we take an evolutionary look at our beginnings, we see a life in which high levels of physical activity were required for survival.

- (A) There are fewer manual jobs, we do not need to travel on foot, we do not need to hunt and harvest for our food, and many domestic chores have been mechanized. While these changes have created many benefits for our longevity and quality of life, they have also created many problems.
- (B) Lack of sufficient physical activity has now been linked to at least 17 unhealthy conditions, almost all of which are chronic diseases or considered risk factors for chronic diseases. Adrienne Hardman has summarized this serious situation for public health: "Physical inactivity is a waste of human potential for health and well-being."
- (C) Even one century ago, most people needed to be physically active to work, to travel, and to take care of homes and families. Our modern world has engineered such activity out of our lives.

It was not until relatively recent times that scientists came to understand the relationships between the structural elements of materials and their properties.

The earliest humans had access to only a very limited number of materials, those that occur naturally: stone, wood, clay, skins, and so on. (①) With time, they discovered techniques for producing materials that had properties superior to those of the natural ones; these new materials included pottery and various metals. (②) Furthermore, it was discovered that the properties of a material could be altered by heat treatments and by the addition of other substances. (③) At this point, materials utilization was totally a selection process that involved deciding from a given, rather limited set of materials, the one best suited for an application based on its characteristics. (④) This knowledge, acquired over approximately the past 100 years, has empowered them to fashion, to a large degree, the characteristics of materials. (⑤) Thus, tens of thousands of different materials have evolved with rather specialized characteristics that meet the needs of our modern and complex society, including metals, plastics, glasses, and fibers.

To minimize vortex shedding, skyscraper designers do everything in their powers to confuse the wind.

To minimize building costs and maximize revenues, skyscrapers generally take the shape of squares or rectangles. These are not particularly aerodynamic shapes, and this results in a wind phenomenon called "vortex shedding." As wind meets a rectangular skyscraper it pushes on the flat face of the building before flowing around its sides, where eventually it separates from the face of the structure. (①) The difference in pressures on the front and back faces of the building gives rise to vortices, or spinning currents of wind, that flow downstream from the building. (②) The vortices pull and push the building in a direction perpendicular to the wind at frequencies that can become dangerously self-sustaining. (③) Orienting the building so that the longer face of the structure is parallel with prevailing winds can help. (④) Chopping or rounding off corners of a building can likewise make it more aerodynamic. (⑤) Roughing up the corners of the building through the careful placement of balconies or stepped corners can help by disturbing or delaying the formation of strong vortices.
