To balance the need for breadth (everyone feels a bit burned out) and depth (some are so burned out, they can no longer do their jobs), we ought to think of burnout not as a state but as a spectrum. In most public discussion of burnout, we talk about workers who "are burned out," as if that status were black and white. A black-and-white view cannot account for the variety of burnout experience, though. If there is a clear line between burned out and not, as there is with a lightbulb, then we have no good way to categorize people who say they are burned out but still manage to do their work competently. Thinking about burnout as a spectrum solves this problem; those who claim burnout but are not debilitated by it are simply dealing with a partial or less-severe form of it. They are experiencing burnout without being burned out. Burnout hasn't had the last word.

- ① Public discussion of burnout has not reached an end.
- ② There still exists room for a greater degree of exhaustion.
- ③ All-or-nothing criteria are applicable to burnout symptoms.
- ④ Exhaustion is overcome in different ways based on its severity.
- ⑤ Degrees of exhaustion are shaped by individuals' perceptions.

Not only musicians and psychologists, but also committed music enthusiasts and experts often voice the opinion that the beauty of music lies in an expressive deviation from the exactly defined score. Concert performances become interesting and gain in attraction from the fact that they go far beyond the information printed in the score. In his early studies on musical performance, Carl Seashore discovered that musicians only rarely play two equal notes in exactly the same way. Within the same metric structure, there is a wide potential of variations in tempo, volume, tonal quality and intonation. Such variation is based on the composition but diverges from it individually. We generally call this 'expressivity'. This explains why we do not lose interest when we hear different artists perform the same piece of music. It also explains why it is worthwhile for following generations to repeat the same repertoire. New, inspiring interpretations help us to expand our understanding, which serves to enrich and animate the music scene.

Viewing the stress response as a resource can transform the physiology of fear into the biology of courage. It can turn a threat into a challenge and can help you ① do your best under pressure. Even when the stress doesn't feel helpful — as in the case of anxiety — welcoming it can transform ② it into something that is helpful: more energy, more confidence, and a greater willingness to take action. You can apply this strategy in your own life anytime you notice signs of stress. When you feel your heart beating or your breath quickening, ③ realizing that it is your body's way of trying to give you more energy. If you notice tension in your body, remind yourself ④ that the stress response gives you access to your strength. Sweaty palms? Remember what it felt like ⑤ to go on your first date — palms sweat when you're close to something you want.

What is soft-path river engineering? One way to visualize its spirit is to liken it to a footpath in the forest. Suppose a tree falls across a footpath. A soft-path response would be simply to redirect the trail around the fallen tree. A more interventionist response would be to ①remove the tree and restore the original route. A still more interventionist response might be to straighten and pave the path to insert it more ②permanently in the landscape. The true high-modernist step would, of course, be to ③create a superhighway that removes the landscape and bulldozes straight through all obstacles in the topography. Soft-path engineering has the unique advantage of intellectual ④modesty with respect to what we actually know about river movement and its environmental effects. In contrast to hard-path engineering, soft-path engineering accepts variability in the river's movement as ⑤insignificant until proven otherwise. Backwaters, short-lived wetlands, braids and channels, swamps— all undesirable to hard-path engineering — are presumed by soft-path engineers to be ecologically important.

One of the factors determining the use of technologies of communication will be the kinds of investments made in equipment and personnel; who makes them, and what they expect in return. There is no guarantee that the investment will necessarily be in forms of communication that . Because the ownership of investment funds tends to be in the hands of commercial organisations, the modernisation of communications infrastructure only takes place on the basis of potential profitability. Take, for example, the installation of fibre-optic communications cable across the African continent. A number of African nations are involved in the development but its operational structures will be oriented to those who can pay for access. Many states that might wish to use it for education and information may not only find it too expensive but also simply unavailable to them. There can be no doubt that the development has been led by investment opportunity rather than community demand.

- ① require minimal cost and effort to maintain
- ② are most appropriate for the majority of people
- ③ are in line with current standards and global norms
- ④ employ some of the most advanced technologies
- ⑤ promote the commercial interests of companies

We understand that the segregation of our consciousness into present, past, and future is both a fiction and an oddly self-referential framework; your present was part of your mother's future, and your children's past will be in part your present. Nothing is generally wrong with structuring our consciousness of time in this conventional manner, and it often works well enough. In the case of climate change, however, the sharp division of time into past, present, and future has been desperately misleading and has, most importantly, hidden from view the extent of the responsibility of those of us alive now. The narrowing of our consciousness of time smooths the way to divorcing ourselves from responsibility for developments in the past and the future with which our lives are in fact deeply intertwined. In the climate case, it is not that _____. It is that the realities are obscured from view by the partitioning of time, and so questions of responsibility toward the past and future do not arise naturally.

- ① all our efforts prove to be effective and are thus encouraged
- ② sufficient scientific evidence has been provided to us
- ③ future concerns are more urgent than present needs
- ④ our ancestors maintained a different frame of time
- ⑤ we face the facts but then deny our responsibility
