The single most important change you can make in your working habits is to switch to creative work first, reactive work second. This means blocking off a large chunk of time every day for creative work on your own priorities, with the phone and e-mail off. I used to be a frustrated writer. Making this switch turned me into a productive writer. Yet there wasn't a single day when I sat down to write an article, blog post, or book chapter without a string of people waiting for me to get back to them. It wasn't easy, and it still isn't, particularly when I get phone messages beginning "I sent you an e-mail two hours ago...!" By definition, this approach goes against the grain of others' expectations and the pressures they put on you. It takes willpower to switch off the world, even for an hour. It feels uncomfortable, and sometimes people get upset. But it's better to disappoint a few people over small things, than to abandon your dreams for an empty inbox. Otherwise, you're sacrificing your potential for the illusion of professionalism.

- ① following an innovative course of action
- ② attempting to satisfy other people's demands
- ③ completing challenging work without mistakes
- ④ removing social ties to maintain a mental balance
- ⑤ securing enough opportunities for social networking

In technological design, an aspiration towards seamlessness aims to make the technological experience for humans blend seamlessly into our everyday lives. Essentially, this aspiration aims towards experiences where people are no longer (a) aware of the technology, the interface or the differences between human-technology and human-human interaction. Considering the metaphor of seams in clothing, we can say that we aspire to seamless aesthetics by stitching the seams closely, pressing them flat and making sure they are (b) hidden on the inside so that we wear clothing rather than pieces of fabric. When designers and engineers talk about technological seamlessness, they are often referring to ease of use and convenience. For example, in interface design, an aspiration towards seamlessness (c) ensures the experience for the user flows and is not stressful or irritating. Most of us would have had experiences of (d) poor interface designs or apps in workplaces that make things more complicated and irritating, and have longed for more seamless interfaces. Technological seamlessness can also include less visible screens in new technologies, or virtual reality technologies with a seamless technological design. The aim is to immerse the user experience such that the visual interaction might be described as inside the screen rather than a body interacting with a digital console or object as separate entities. Similarly, seamlessness in humanoid robotic design aims to make humanoids (e) distinguishable from a human body.

Partly in response to Freud's ideas, Jean Piaget suggested that children up to the age of about seven years remain locked within a self-centered view of the world ① which he called cognitive egocentrism. This can be seen as midway between Freudian infantile autism and the fully ② socialized awareness that adults possess. Despite being able to talk, infants fail to realize that other people may perceive and know different things from ③ themselves. This means that the child does not understand itself properly as a thinking being since it has not realized that its own thoughts, perceptions, knowledge and memories ④ being dependent on its own particular experience and perspective. Only when children realize that other people can have systematically different experiences and perspectives from their own, are they able to take a perspective on their own thoughts and, one might say, ⑤ know about their own minds. autism 자폐증

Everywhere we turn we hear about almighty "cyberspace"! The hype promises that we will leave our boring lives, put on goggles and body suits, and enter some metallic, three-dimensional, multimedia otherworld. When the Industrial Revolution arrived with its great innovation, the motor, we didn't leave our world to go to some ① remote motorspace! On the contrary, we brought the motors into our lives, as automobiles, refrigerators, drill presses, and pencil sharpeners. This ② absorption has been so complete that we refer to all these tools with names that declare their usage, not their "motoriness." These innovations led to a major socioeconomic movement precisely because they entered and ③ affected profoundly our everyday lives. People have not changed fundamentally in thousands of years. Technology changes constantly. It's the one that must ④ adapt to us. That's exactly what will happen with information technology and its devices under human-centric computing. The longer we continue to believe that computers will take us to a magical new world, the longer we will ⑤ maintain their natural fusion with our lives, the hallmark of every major movement that aspires to be called a socioeconomic revolution.

Over the last decade the attention given to how children learn to read has foregrounded the nature of textuality, and of the different, interrelated ways in which readers of all ages make texts mean. 'Reading' now applies to a greater number of representational forms than at any time in the past: pictures, maps, screens, design graphics and photographs are all regarded as text. In addition to the innovations made possible in picture books by new printing processes, design features also predominate in other kinds, such as books of poetry and information texts. Thus, reading becomes a more complicated kind of interpretation than it was when children's attention was focused on the printed text, with sketches or pictures as an adjunct. Children now learn from a picture book that words and illustrations complement and enhance each other. Reading is not simply . Even in the easiest texts, what a sentence 'says' is often not what it means.

- ① knowledge acquisition
- ② word recognition
- ③ imaginative play
- ④ subjective interpretation
- ⑤ image mapping

We are famously living in the era of the attention economy, where the largest and most profitable businesses in the world are those that consume my attention. The advertising industry is literally dedicated to capturing the conscious hours of my life and selling them to someone else. It might seem magical that so many exciting and useful software systems are available to use for free, but it is now conventional wisdom that if you can't see who is paying for something that appears to be free, then _____. Our creative engagement with other people is mediated by AI-based recommendation systems that are designed to trap our attention through the process that Nick Seaver calls captology, keeping us attending to work sold by one company rather than another, replacing the freedom of personal exploration with algorithm-generated playlists or even algorithm-generated art.

- ① all of your attention has already been spent
- ② the real product being sold is you
- ③ your privacy is being violated
- ④ the public may be sponsoring you
- ⑤ you owe the benefits to your friend AI
