Flicking the collaboration light switch is something that leaders are uniquely positioned to do, because several obstacles stand in the way of people voluntarily working alone. For one thing, the fear of being left out of the loop can keep them glued to their enterprise social media. Individuals don't want to be or appear to be isolated. For another, knowing what their teammates are doing provides a sense of comfort and security, because people can adjust their own behavior to be in harmony with the group. It's risky to go off on their own to try something new that will probably not be successful right from the start. But even though it feels reassuring for individuals to be hyperconnected, it's better for the organization if they periodically go off and think for themselves and generate diverse if not quite mature ideas. Thus, it becomes the leader's job to create conditions that are good for the whole by enforcing intermittent interaction even when people wouldn't choose it for themselves, without making it seem like a punishment.

*intermittent: 간헐적인

- ① breaking physical barriers and group norms that prohibit cooperation
- ② having people stop working together and start working individually
- ③ encouraging people to devote more time to online collaboration
- ④ shaping environments where higher productivity is required
- ⑤ requiring workers to focus their attention on group projects

The approach, joint cognitive systems, treats a robot as part of a human-machine team where the intelligence is synergistic, arising from the contributions of each agent. The team consists of at least one robot and one human and is often called a mixed team because it is a mixture of human and robot agents. Self-driving cars, where a person turns on and off the driving, is an example of a joint cognitive system. Entertainment robots are examples of mixed teams as are robots for telecommuting. The design process concentrates on how the agents will cooperate and coordinate with each other to accomplish the team goals. Rather than treating robots as peer agents with their own completely independent agenda, joint cognitive systems approaches treat robots as helpers such as service animals or sheep dogs. In joint cognitive system designs, artificial intelligence is used along with human-robot interaction principles to create robots that can be intelligent enough to be good team members.

- ② Can Robots Join Forces to Outperform Human Teams?
- ③ Loss of Humanity in the Human and Machine Conflict

Trying to do everything makes multitaskers poor editors. Those who consistently attempt multitasking find it harder to ignore irrelevant information and ① to take longer moving between tasks – in other words, for all their frantic activity, they're actually wasting time. And because the brains competing memory systems store information differently, ② whatever is retained is harder for the multitasker to recall. While these energetic minds might feel that they're on top of the world of information, in reality they are at ③ its mercy. So how we work creates its own feedback loop: the more attention we try to pay to everything, ④ the less discerning we become. But when we focus, we get better at concentrating – and remembering what we did. We feel less exhausted. So monotasking – focusing on one task at a time – isn't only more efficient; it also leaves us better ⑤ able to use the knowledge we have gained.

Although the wonders of modern technology have provided people with opportunities beyond the wildest dreams of our ancestors, the good, as usual, is weakened by a downside. One of those downsides is that anyone who so chooses can pick up the virtual megaphone that is the Internet and put in their two cents on any of an infinite number of topics, regardless of their ① qualifications. After all, on the Internet, there are no regulations ② preventing a kindergarten teacher from offering medical advice or a physician from suggesting ways to safely make structural changes to your home. As a result, misinformation gets disseminated as information, and it is not always easy to ③ differentiate the two. This can be particularly frustrating for scientists, who spend their lives learning how to understand the intricacies of the world around them, only to have their work summarily ④ challenged by people whose experience with the topic can be measured in minutes. This frustration is then ⑤ diminished by the fact that, to the general public, both the scientist and the challenger are awarded equal credibility.

When gathering the preferences of multiple agents into one collective choice, it is easily seen that certain cases _____. For example, if there are two alternatives, a and b, and two agents such that one prefers a and the other one b, there is no deterministic way of selecting a single alternative without violating one of two basic fairness conditions known as anonymity and neutrality. Allowing lotteries as social outcomes hence seems like a necessity for impartial collective choice. Indeed, most common "deterministic" social choice functions such as plurality rule are only deterministic as long as there is no tie, which is usually resolved by drawing a lot. The use of lotteries for the selection of officials interestingly goes back to the world's first democracy in Athens, where it was widely regarded as a principal characteristic of democracy, and has recently gained increasing attention in political science.

- ① call for randomization or other means of tiebreaking
- ② demonstrate how impartial selection could be invalidated
- ③ necessitate deterministic systems of selecting voters blindly
- ④ rely upon neutral agents to establish clear selection guidelines
- ⑤ require understanding of the unpredictability inherent in democracy

It is important to recognise the interdependence between individual, culturally formed actions and the state of cultural integration. People work within the forms provided by the cultural patterns that they have internalised, however contradictory these may be. Ideas are worked out as logical implications or consequences of other accepted ideas, and it is in this way that cultural innovations and discoveries are possible. New ideas are discovered through logical reasoning, but such discoveries are inherent in and integral to the conceptual system and are made possible only because of the acceptance of its premises. For example, the discoveries of new prime numbers are 'real' consequences of the particular number system employed. Thus, cultural ideas show 'advances' and 'developments' because they . The cumulative work of many individuals produces a corpus of knowledge within which certain 'discoveries' become possible or more likely. Such discoveries are 'ripe' and could not have occurred earlier and are also likely to be made simultaneously by numbers of individuals. 3점

*corpus: 집적() **simultaneously: 동시에

- ① are outgrowths of previous ideas
- ② stem from abstract reasoning ability
- ③ form the basis of cultural universalism
- ④ emerge between people of the same age
- ⑤ promote individuals' innovative thinking
