

2027학년도 수능 대비 모의평가

1. 밑줄 친 부분이 다음 글에서 의미하는 바로 가장 적절한 것은?

Around the turn of the twentieth century, anthropologists trained in the natural sciences began to reimagine what a science of humanity should look like and how social scientists ought to go about studying cultural groups. Some of those anthropologists insisted that one should at least spend significant time actually observing and talking to the people studied. Early ethnographers such as Franz Boas and Alfred Cort Haddon typically traveled to the remote locations where the people in question lived and spent a few weeks to a few months there. They sought out a local Western host who was familiar with the people and the area (such as a colonial official, missionary, or businessman) and found accommodations through them. Although they did at times venture into the community without a guide, they generally did not spend significant time with the local people. Thus, their observations were primarily conducted from their verandas.

- ① seeking to build long-lasting relationships with the natives
- ② participating in collaborative research with natural scientists
- ③ engaging in little direct contact with the people being studied
- ④ cooperating actively with Western hosts in the local community
- ⑤ struggling to take a wider view of the native culture examined

2. 다음 글의 제목으로 가장 적절한 것은? (3점)

Different parts of the brain's visual system get information on a need-to-know basis. Cells that help your hand muscles reach out to an object need to know the size and location of the object, but they don't need to know about color. They need to know a little about shape, but not in great detail. Cells that help you recognize people's faces need to be extremely sensitive to details of shape, but they can pay less attention to location. It is natural to assume that anyone who sees an object sees everything about it—the shape, color, location, and movement. However, one part of your brain sees its shape, another sees color, another detects location, and another perceives movement. Consequently, after localized brain damage, it is possible to see certain aspects of an object and not others. Centuries ago, people found it difficult to imagine how someone could see an object without seeing what color it is. Even today, you might find it surprising to learn about people who see an object without seeing where it is, or see it without seeing whether it is moving.

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

How ① closely related are your concept of success and the type of work you are doing or training to do? We can probably find more variations in ② what work means in a person's life than in any other aspect of daily living. Some people think of work solely as a means of making money ③ to satisfy other needs. A few think of it merely as something to do. Others recognize these purposes but view their work as an opportunity to lead a ④ challenging, productive life. They are involved in developing their potential, in becoming more self-actualized. With almost everyone, work enters into the concept of success. This is true even for people who say, "If I were rich, I wouldn't work." For most of us, then, it is practical to consider ⑤ how work-related goals fit into our broader goals in life.

4. 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

We all like to think of ourselves as rational actors, careful and considered in our thinking, capable of sound and reliable judgments. We might believe that we generally consider different points of view and make ①informed decisions. We are, in fact, "predictably irrational," as psychologist Dan Ariely titled his book on the topic. All of us engage in automatic, reflexive thinking, typically taking the ②easier path and conserving mental effort. Although we each may have the subjective impression that we are careful thinkers, we often make snap judgments or no real judgments at all. In addition, numerous biases inhibit or override reflective, deliberative thought; intuitive theories can also interfere with ③acceptance of accurate scientific explanations. Understanding more about how our minds work and how biases may operate can make us each ④less subject to fallacious reasoning, more rational, and more aware of the problems in others' thinking. Learning to understand the built-in ⑤rationality of our mental processes can also help us improve our ability to inform others more effectively.

5. 다음 빈칸에 들어갈 말로 가장 적절한 것을 고르시오.

One of the common themes of the Western philosophical tradition is the distinction between sensual perceptions and rational knowledge. Since Plato, the supremacy of rational reason is based on the assertion that it is able to extract true knowledge from experience. As the discussion in the Republic helps to explain, perceptions are inherently unreliable and misleading because the senses are subject to errors and illusions. Only the rational discourse has the tools to overcome illusions and to point towards true knowledge. For instance, perception suggests that a figure in the distance is smaller than it really is. Yet, the application of logical reasoning will reveal that the figure only appears small because it obeys the laws of geometrical perspective. Nevertheless, even after the perspectival correction is applied and reason concludes that perception is misleading, the figure still appears small, and the truth of the matter is revealed .

- ① as the outcome of blindly following sensual experience
- ② by moving away from the idea of perfect representation
- ③ beyond the limit of where rational knowledge can approach
- ④ through a variety of experiences rather than logical reasoning
- ⑤ not in the perception of the figure but in its rational representation

6. 다음 빈칸에 들어갈 말로 가장 적절한 것을 고르시오. (3점)

People have always wanted to be around other people and to learn from them. Cities have long been dynamos of social possibility, foundries of art, music, and fashion. Slang, or, if you prefer, "lexical innovation," has always started in cities — an outgrowth of all those different people so frequently exposed to one another. It spreads outward, in a manner not unlike trans-missile disease, which itself typically "takes off" in cities. If, as the noted linguist Leonard Bloomfield argued, the way a person talks is a "composite result of what he has heard before," then language innovation would happen where the most people heard and talked to the most other people. Cities drive taste change because they _____, who not surprisingly are often the creative people cities seem to attract. Media, ever more global, ever more far-reaching, spread language faster to more people.

- ① provide rich source materials for artists
- ② offer the greatest exposure to other people
- ③ cause cultural conflicts among users of slang
- ④ present ideal research environments to linguists
- ⑤ reduce the social mobility of ambitious outsiders
