To whom it may concern, My name is Daniel. Since I joined your youth sports program several years ago, I have really enjoyed swimming. Thanks to your program, I have become a good swimmer. Now I want to go one step further. I like helping people and hope to get a job as a lifeguard later. So I tried to sign up for your lifeguard training course this summer. But the course was so popular that the registration closed almost as soon as it opened. I couldn't register and was really disappointed. I heard some of my friends couldn't, either. I'm kindly asking you to open an additional course. I appreciate your consideration. Sincerely, Daniel Smith

There are pressures within the museum that cause it to emphasize what happens in the galleries over the activities that take place in its unseen zones. In an era when museums are forced to increase their earnings, they often focus their energies on modernising their galleries or mounting temporary exhibitions to bring more and more audiences through the door. In other words, as museums struggle to survive in a competitive economy, their budgets often prioritise those parts of themselves that are consumable: infotainment in the galleries, goods and services in the cafes and the shops. The unlit, unglamorous storerooms, if they are ever discussed, are at best presented as service areas that process objects for the exhibition halls. And at worst, as museums pour more and more resources into their publicly visible faces, the spaces of storage may even suffer, their modernisation being kept on hold or being given less and less space to house the expanding collections and serve their complex conservation needs.

- ② benefits of diverse activities in museums for audiences
- ③ necessity of expanding storerooms for displaying objects
- ④ consequences of profit-oriented management of museums
- ⑤ ways to increase museums' commitment to the public good

Radioactive waste disposal has become one of the key environmental battlegrounds over which the future of nuclear power has been fought. Environmentalists argue that no system of waste disposal can be absolutely safe, either now or in the future. Governments and the nuclear industry have tried to find acceptable solutions. But in countries where popular opinion is taken into consideration, no mutually acceptable solution has been found. As a result, most spent fuel has been stored in the nuclear power plants where it was produced. This is now causing its own problems as storage ponds designed to store a few years' waste become filled or overflowing. One avenue that has been explored is the reprocessing of spent fuel to remove the active ingredients. Some of the recovered material can be recycled as fuel. The remainder must be stored safely until it has become inactive. But reprocessing has proved expensive and can exacerbate the problem of disposal rather than assisting it. As a result, it too appears publicly unacceptable.

Think of yourself. When you decide to get up and get a drink of water, for example, you don't consciously organize or consider the host of steps involved. Imagine if we ①had to consider every single muscle that needed to be contracted or relaxed just to stand up and walk. It would be tiresome and very slow as patients recovering from a brain injury affecting the motor system ②knows. The autopilot parts of our brain do it for us automatically, ③freeing up our conscious mind for more important jobs. It is the older parts of our brain ④that support these automatic processes that allow us to move, hear, see, and use many of our social skills. More recently evolved abilities like talking, reading, and writing are far less automated. So, most of the time, ⑤what you are perceiving, feeling, or thinking is based on a very crude and fast analysis that happens completely without your awareness.

After the United Nations environmental conference in Rio de Janeiro in 1992 made the term "sustainability" widely known around the world, the word became a popular buzzword by those who wanted to be seen as pro-environmental but who did not really intend to change their behavior. It became a public relations term, an attempt to be seen as abreast with the latest thinking of what we must do to save our planet from widespread harm. But then, in a decade or so, some governments, industries, educational institutions, and organizations started to use the term in a serious manner. In the United States a number of large corporations appointed a vice president for sustainability. Not only were these officials interested in how their companies could profit by producing "green" products, but they were often given the task of making the company more efficient by reducing wastes and pollution and by reducing its carbon emissions.

While the term "sustainability," in the initial phase, was popular among those who (A) to be eco-conscious, it later came to be used by those who would (B) their pro-environmental thoughts.
