Children can move effortlessly between play and absorption in a story, as if both are forms of the same activity. The taking of roles in a narratively structured game of pirates is not very different than the taking of roles in identifying with characters as one watches a movie. It might be thought that, as they grow towards adolescence, people give up childhood play, but this is not so. Instead, the bases and interests of this activity change and develop to playing and watching sports, to the fiction of plays, novels, and movies, and nowadays to video games. In fiction, one can enter possible worlds. When we experience emotions in such worlds, this is not a sign that we are being incoherent or regressed. It derives from trying out metaphorical transformations of our selves in new ways, in new worlds, in ways that can be moving and important to us.

- ① relationship between play types and emotional stability
- ② reasons for identifying with imaginary characters in childhood
- ③ ways of helping adolescents develop good reading habits
- ④ continued engagement in altered forms of play after childhood
- ⑤ effects of narrative structures on readers' imaginations

Hyper-mobility the notion that more travel at faster speeds covering longer distances generates greater economic success seems to be a distinguishing feature of urban areas, where more than half of the world's population currently reside. By 2005, approximately 7.5 billion trips were made each day in cities worldwide. In 2050, there may be three to four times as many passenger-kilometres travelled as in the year 2000, infrastructure and energy prices permitting. Freight movement could also rise more than threefold during the same period. Mobility flows have become a key dynamic of urbanization, with the associated infrastructure invariably constituting the backbone of urban form. Yet, despite the increasing level of urban mobility worldwide, access to places, activities and services has become increasingly difficult. Not only is it less convenient in terms of time, cost and comfort to access locations in cities, but the very process of moving around in cities generates a number of negative externalities. Accordingly, many of the world's cities face an unprecedented accessibility crisis, and are characterized by unsustainable mobility systems.

We are exceptionally smart, and this helps us adapt to a wide range of environments. But we are not nearly smart enough as individuals ①to solve the adaptive problems that confronted modern humans as they spread across the globe. The package of tools, foraging techniques, ecological knowledge, and social arrangements used by any group of foragers ②being far too complex for any individual to create. We are able to learn all the things we need to know in each of the many different environments ③in which we live only because we acquire information from others. We are much better at learning from others than other species are, and we are ④motivated to learn from others even when we do not understand why our models are doing what they are doing. This psychology allows human populations to accumulate pools of adaptive information that ⑤greatly exceed the inventive capacities of individuals.

Philip Kitcher and Wesley Salmon have suggested that there are two possible alternatives among philosophical theories of explanation. One is the view that scientific explanation consists in the unification of broad bodies of phenomena under a minimal number of generalizations. According to this view, the (or perhaps, a) goal of science is to construct an economical framework of laws or generalizations that are capable of subsuming all observable phenomena. Scientific explanations organize and systematize our knowledge of the empirical world; the more economical the systematization, the deeper our understanding of what is explained. The other view is the causal/mechanical approach. According to it, a scientific explanation of a phenomenon consists of uncovering the mechanisms that produced the phenomenon of interest. This view sees the explanation of individual events as primary, with the explanation of generalizations flowing from them. That is, the explanation of scientific generalizations comes from the causal mechanisms that produce the regularities.

Scientific explanations can be made either by seeking the ____ (A) ____ number of principles covering all observations or by finding general ____ (B) ____ drawn from individual phenomena.

- | (A) | (B) | (A) | (B) |
|-----------|-------------------|---------|----------------|
| ① least | patterns | ② fixed | features |
| ③ limited | functions | ④ fixed | rules |
| ⑤ least | assumptions | | |
