Dear Ms. Burke, Thank you for your question about how to donate children's books for our book drive. The event will take place for one week from September 10th to 16th. Books can be dropped off 24 hours a day during this period. There are two locations designated for donations: Adams Children's Library and Aileen Community Center. At each location, there are blue donation boxes at the main entrance. If you are unable to visit these locations, books can be mailed directly to our organization. Your donations will help support children in our community who may not be able to afford books. We hope this information makes your donation easier. We appreciate your support. Best regards, Carrie Wells

Sensory-specific satiety is defined as a decrease in appetite, or the subjective liking for the food that is consumed, with little change in the hedonics of uneaten food. As a result of sensory-specific satiety, when people consume a variety of foods, they tend to overeat. A greater variety of food leads people to eat more than they would otherwise. So, being full and feeling sated are separate matters. The recovery of appetite or the motivation to eat is apparent to anyone who has consumed a large meal and is quite full, and does not require additional energy or nutrients to meet their daily needs, but decides to consume additional calories after seeing the dessert cart. Small changes in the sensory properties of foods are sufficient to increase food intake. For example, subjects who were presented with different shapes of pasta showed increased hedonic ratings and increased energy consumption relative to subjects eating only a single shape of pasta.

- ① necessity of consuming a varied diet in daily life
- ② reasons for people's rejection of unfamiliar foods
- ③ changes in people's preference for basic food items
- ④ impact of food variety on the amount of food people consume
- ⑤ importance of maintaining food diversity to prevent overeating

Although cognitive and neuropsychological approaches emphasize the losses with age that might impair social perception, motivational theories indicate that there may be some gains or qualitative changes. Charles and Carstensen review a considerable body of evidence indicating that, as people get older, they tend to prioritize close social relationships, focus more on achieving emotional well-being, and attend more to positive emotional information while ignoring negative information. These changing motivational goals in old age have implications for attention to and processing of social cues from the environment. Of particular importance in considering emotional changes in old age is the presence of a positivity bias: that is, a tendency to notice, attend to, and remember more positive compared to negative information. The role of life experience in social skills also indicates that older adults might show gains in some aspects of social perception.

Ecosystems differ in composition and extent. They can be defined as ranging from the communities and interactions of organisms in your mouth or ①those in the canopy of a rain forest to all those in Earth's oceans. The processes ②governing them differ in complexity and speed. There are systems that turn over in minutes, and there are others ③which rhythmic time extends to hundreds of years. Some ecosystems are extensive ('biomes', such as the African savanna); some cover regions (river basins); many involve clusters of villages (micro-watersheds); others are confined to the level of a single village (the village pond). In each example there is an element of indivisibility. Divide an ecosystem into parts by creating barriers, and the sum of the productivity of the parts will typically be found to be lower than the productivity of the whole, other things ④being equal. The mobility of biological populations is a reason. Safe passages, for example, enable migratory species ⑤to survive.

The idea that planting trees could have a social or political significance appears to have been invented by the English, though it has since spread widely. According to Keith Thomas's history *Man and the Natural World*, seventeenth- and eighteenth-century aristocrats began planting hardwood trees, usually in lines, to declare the extent of their property and the permanence of their claim to it. "What can be more pleasant," the editor of a magazine for gentlemen asked his readers, "than to have the bounds and limits of your own property preserved and continued from age to age by the testimony of such living and growing witnesses?" Planting trees had the additional advantage of being regarded as a patriotic act, for the Crown had declared a severe shortage of the hardwood on which the Royal Navy depended.

For English aristocrats, planting trees served as statements to mark the (A) ownership of their land, and it was also considered to be a(n) (B) of their loyalty to the nation.
