Dear Ms. Larson, I am writing to you with new information about your current membership. Last year, you signed up for our museum membership that provides special discounts. As stated in the last newsletter, this year we are happy to be celebrating our 50th anniversary. So we would like to offer you further benefits. These include free admission for up to ten people and 20% off museum merchandise on your next visit. You will also be invited to all new exhibition openings this year at discounted prices. We hope you enjoy these offers. For any questions, please feel free to contact us. Best regards, Stella Harrison

- ① 박물관 개관 50th 주년 기념행사 취소를 공지하려고
- ② 작년에 가입한 박물관 멤버십의 갱신을 요청하려고
- ③ 박물관 멤버십 회원을 위한 추가 혜택을 알려 주려고
- ④ 박물관 기념품점에서 새로 판매할 상품을 홍보하려고
- ⑤ 박물관 전시 프로그램에서 변경된 내용을 안내하려고

Considerable work by cultural psychologists and anthropologists has shown that there are indeed large and sometimes surprising differences in the words and concepts that different cultures have for describing emotions, as well as in the social circumstances that draw out the expression of particular emotions. However, those data do not actually show that different cultures have different emotions, if we think of emotions as central, neurally implemented states. As for, say, color vision, they just say that, despite the same internal processing architecture, how we interpret, categorize, and name emotions varies according to culture and that we learn in a particular culture the social context in which it is appropriate to express emotions. However, the emotional states themselves are likely to be quite invariant across cultures. In a sense, we can think of a basic, culturally universal emotion set that is shaped by evolution and implemented in the brain, but the links between such emotional states and stimuli, behavior, and other cognitive states are plastic and can be modified by learning in a specific cultural context.

- ① essential links between emotions and behaviors
- ② culturally constructed representation of emotions
- ③ falsely described emotions through global languages
- ④ universally defined emotions across academic disciplines
- ⑤ wider influence of cognition on learning cultural contexts

Different parts of the brain's visual system get information on a need-to-know basis. Cells that help your hand muscles reach out to an object need to know the size and location of the object, but they don't need to know about color. They need to know a little about shape, but not in great detail. Cells that help you recognize people's faces need to be extremely sensitive to details of shape, but they can pay less attention to location. It is natural to assume that anyone who sees an object sees everything about it — the shape, color, location, and movement. However, one part of your brain sees its shape, another sees color, another detects location, and another perceives movement. Consequently, after localized brain damage, it is possible to see certain aspects of an object and not others. Centuries ago, people found it difficult to imagine how someone could see an object without seeing what color it is. Even today, you might find it surprising to learn about people who see an object without seeing where it is, or see it without seeing whether it is moving.

The lack of real, direct experience in and with nature has caused many children to regard the natural world as mere abstraction, that fantastic, beautifully filmed place ①filled with endangered rainforests and polar bears in peril. This overstated, often fictionalized version of nature is no more real — and yet no less real — to them than the everyday nature right outside their doors, ②waits to be discovered in a child's way, at a child's pace. Consider the University of Cambridge study which found that a group of eight-year-old children was able to identify ③substantially more characters from animations than common wildlife species. One wonders whether our children's inherent capacity to recognize, classify, and order information about their environment — abilities once essential to our very survival — is slowly devolving to facilitate life in ④their increasingly virtualized world. It's all part of ⑤what Robert Pyle first called "the extinction of experience."

*peril: 위험 **devolve: 퇴화하다

5. 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

In most fiction, characters' lives are limited to the individual work. Readers may disagree on the characteristics and traits of fictional figures, and in drama there is room for different interpretations of characters. However, it is less common for characters in literary fiction to reappear in subsequent works than in genre fiction, where series featuring the same central characters are common. This is even more pronounced in comics, which are typically serialized in newspaper strips or comic books. Thus characters introduced in the 1930s, like Superman and Batman, may still enjoy new adventures decades later. During these characters' long histories, they change in various ways for a variety of reasons. If a character is created by a single author, like Sherlock Holmes, the character's core traits may change little from story to story, but readers learn more about him with each successive story. On the other hand, if characters are the work of several hands over decades, they may change considerably.

While characters in most literary fiction hardly ever ____ (A) ____ in successive works, those in genre fiction and comics often do so, and may undergo ____ (B) ____ in their traits especially when written about by different authors over time.

- | (A) | (B) | (A) | (B) |
|-------------|----------------------|-----------|----------------------|
| ① resurface | simplification | ② endure | degradation |
| ③ fade | variation | ④ feature | transformation |
| ⑤ disappear | fossilization | | |
